#### Abstract

This paper presents multi-attribute decision making based on rough neutrosophic hyper-complex sets with rough neutrosophic hyper-complex attribute values. The concept of neutrosophic hypercomplex set is a powerful mathematical tool to deal with incomplete, indeterminate and inconsistent information. We extend the concept of neutrosophic hyper-complex set to rough neutrosophic hyper-complex set. The ratings of all alternatives have been expressed in terms of the upper and lower approximations and the pair of neutrosophic hyper-complex sets which are characterized by two hyper-complex functions and an indeterminacy component. We also define cosine function based on rough neutrosophic hyper-complex set to determine the degree of similarity between rough neutrosophic hyper-complex sets. We establish new decision making approach based on rough neutrosphic hyper-complex set. Finally, a numerical example has been furnished to demonstrate the applicability of the proposed approach.

## Keyword

Neutrosophic set, Rough neutrosophic set, Rough neutrosophic hyper-complex set, Cosine function, Decision making.

## 1. Introduction

The concept of rough neutrosophic set has been introduced by Broumi et al. [1, 2]. It has been derived as a combination of the concepts of rough set proposed by Z. Pawlak [3] and neutrosophic set introduced by F. Smarandache [4,5]. Rough sets and neutrosophic sets are both capable of dealing with partial information and uncertainty. To deal with real world problems, Wang et al. [6] introduced single valued netrosophic sets (SVNSs).

Recently, Mondal and Pramanik proposed a few decision making models in rough neutrosophic environment. Mondal and Pramanik [7] applied the concept of grey relational
analysis to rough neutrosophic multi-attribte decision making problems. Pramanik and Mondal [8] studied cosine similarity measure of rough neutrosophic sets and its application in medical diagnosis. Mondal and Pramanik [9] proposed multi attribute decision making approach using rough accuracy score function. Pramanik and Mondal [10] also proposed cotangent similarity measure under rough neutrosophic sets. The same authors [11] further studied some similarity measures namely Dice similarity measure [12] and Jaccard similarity measure [12] in rough neutrosophic environment.

Rough neutrosophic hyper-complex set is the generalization of rough neutrosophic set [1, 2] and neutrosophic hyper-complex sets [13]. S. Olariu [14] introduced the concept of hypercomplex number and studied some of its properties. Mandal and Basu [15] studied hypercomplex similarity measure for SVNS and its application in decision making. Mondal and Pramanik [16] studied tri-complex rough neutrosophic similarity measure and presented an application in multi-attribute decision making.

In this paper, we have defined rough neutrosophic hyper-complex set and rough neutrosophic hyper-complex cosine function (RNHCF). We have also proposed a multiattribute decision making approach in rough neutrosophic hyper-complex environment.

Rest of the paper is organized in the following way. Section 2 presents preliminaries of neutrosophic sets, single valued neutrosophic sets and some basic ideas of hyper-complex sets. Section 3 gives the definition of rough neutrosophic hyper-complex sets. Section 4 gives the definition of rough neutrosophic hyper-complex cosine function. Section 5 is devoted to present multi attribute decision-making method based on rough neutrosophic hypercomplex cosine function. Section 6 presents a numerical example of the proposed approach. Finally section 7 presents concluding remarks and scope of future research.

## 2. Neutrosophic Preliminaries

Neutrosophic set is derived from neutrosophy [4].

### 2.1 Neutrosophic set

## Definition 2.1[4, 5]

Let $U$ be a universe of discourse. Then a neutrosophic set A can be presented in the form:

$$
\begin{equation*}
A=\left\{<x: T_{A}(x), I_{A}(x), F_{A}(x)>, x \in U\right\}, \tag{1}
\end{equation*}
$$

where the functions T, I, F: U $\rightarrow]^{-} 0,1^{+}$[ represent respectively the degree of membership, the degree of indeterminacy, and the degree of non-membership of the element $x \in U$ to the set Asatisfying the following the condition.

$$
\begin{equation*}
-0 \leq \sup _{\mathrm{A}}(\mathrm{x})+\operatorname{supI}_{\mathrm{A}}(\mathrm{x})+\operatorname{supF}_{\mathrm{A}}(\mathrm{x}) \leq 3^{+} \tag{2}
\end{equation*}
$$

Wang et al. [6] mentioned that the neutrosophic set assumes the values from the real standard or non-standard subsets of $]^{-0}, 1^{+}[$based on philosophical point of view. So instead of $]^{-} 0,1^{+}[$Wang et al. [6] consider the interval $[0,1]$ for technical applications, because ]-0, $1^{+}[$is difficult to apply in the real applications such as scientific and engineering problems. For two netrosophic sets (NSs),

$$
\begin{equation*}
A_{N S}=\left\{<x: T_{A}(x), I_{A}(x), F_{A}(x)>\mid x \in X\right\} \tag{3}
\end{equation*}
$$

And

$$
\begin{equation*}
\mathrm{B}_{\mathrm{NS}}=\left\{<\mathrm{x}, \mathrm{~T}_{\mathrm{B}}(\mathrm{x}), \mathrm{I}_{\mathrm{B}}(\mathrm{x}), \mathrm{F}_{\mathrm{B}}(\mathrm{x})>\mid \mathrm{x} \in \mathrm{X}\right\}, \tag{4}
\end{equation*}
$$

the two relations are defined as follows:
(1) Ans $\subseteq B_{N S}$ if and only if $T_{A}(x) \leq T_{B}(x), I_{A}(x) \geq I_{B}(x), F_{A}(x) \geq F_{B}(x)$
(2) $A_{N S}=B_{N S}$ if and only if $T_{A}(x)=T_{B}(x), I_{A}(x)=I_{B}(x), F_{A}(x)=F_{B}(x)$

## 2. 2 Single valued neutrosophic sets (SVNS)

Definition 2.2 [6]
Assume that X is a space of points (objects) with generic elements in X denoted by x . A SVNS A in $X$ is characterized by a truth-membership function $T_{A}(x)$, an indeterminacymembership function $\mathrm{I}_{\mathrm{A}}(\mathrm{x})$, and a falsity membership function $\mathrm{F}_{\mathrm{A}}(\mathrm{x})$, for each point x in X , $T_{A}(x), I_{A}(x), F_{A}(x) \in[0,1]$. When $X$ is continuous, a SVNS A can be written as follows:

$$
\begin{equation*}
\mathrm{A}=\int_{\mathrm{x}} \frac{\left\langle\mathrm{~T}_{\mathrm{A}}(\mathrm{x}), \mathrm{I}_{\mathrm{A}}(\mathrm{x}), \mathrm{F}_{\mathrm{A}}(\mathrm{x})\right\rangle}{\mathrm{x}}: \mathrm{x} \in \mathrm{X} \tag{5}
\end{equation*}
$$

When X is discrete, a SVNS A can be written as:

$$
\begin{equation*}
\mathrm{A}=\sum_{\mathrm{i}=1}^{\mathrm{n}} \frac{\left\langle\mathrm{~T}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right), \mathrm{I}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right), \mathrm{F}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)\right\rangle}{\mathrm{x}_{\mathrm{i}}}: \mathrm{x}_{\mathrm{i}} \in \mathrm{X} \tag{6}
\end{equation*}
$$

For two SVNSs,
$A_{\text {svns }}=\left\{<\mathrm{x}: \mathrm{T}_{\mathrm{A}}(\mathrm{x}), \mathrm{I}_{\mathrm{A}}(\mathrm{x}), \mathrm{F}_{\mathrm{A}}(\mathrm{x})>\mid \mathrm{x} \in \mathrm{X}\right\}$
and
$B_{s v n s}=\left\{<x, T_{B}(x), I_{B}(x), F_{B}(x)>\mid x \in X\right\}$,
the two relations are defined as follows:
(i) Asvns $\subseteq$ Bsvns if and only if $T_{A}(x) \leq T_{B}(x), I_{A}(x) \geq I_{B}(x), F_{A}(x) \geq F_{B}(x)$
(ii) $A_{\text {svNS }}=B_{S V N S}$ if and only if $T_{A}(x)=T_{Q}(x), I_{A}(x)=I_{B}(x), F_{A}(x)=F_{B}(x)$ for any $x \in X$

### 2.3. Basic concept of Hyper-complex number of dimension $\mathbf{n}$ [13]

The hyper-complex number of dimension $n$ (or $n$-complex number) was defined by S. Olariu [13] as a number of the form:

$$
\begin{align*}
& \mathrm{u}=\mathrm{h}_{0} \mathrm{x}_{0}+\mathrm{h}_{1} \mathrm{x}_{1}+\mathrm{h}_{2} \mathrm{x}_{2}+\ldots+\mathrm{h}_{\mathrm{n}-1} \mathrm{x}_{\mathrm{n}-1} \\
& =\mathrm{h}_{0} \mathrm{x}_{0}+\mathrm{h}_{1} \mathrm{x}_{1}+\mathrm{h}_{2} \mathrm{x}_{2}+\ldots+\mathrm{h}_{\mathrm{n}-1} \mathrm{x}_{\mathrm{n}-1} \tag{9}
\end{align*}
$$

where $\mathrm{n} \geq 2$, and the variables $\mathrm{x}_{0}, \mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{n}-1}$ are real numbers, while $\mathrm{h}_{1}, \mathrm{~h}_{2}, \ldots, \mathrm{~h}_{\mathrm{n}-1}$ are the complex units, $h_{o}=1$, and they are multiplied as follows:

$$
\begin{equation*}
h_{j} h_{k}=h_{j+k} \text { if } 0 \leq j+k \leq n-1 \text {, and } h_{j} h_{k}=h_{j+k-n} \text { if } n \leq j+k \leq 2 n-2 . \tag{10}
\end{equation*}
$$

The above complex unit multiplication formulas can be written in a simpler form as:

$$
\begin{equation*}
\mathrm{h}_{\mathrm{j}} \mathrm{~h}_{\mathrm{k}}=\mathrm{h}_{\mathrm{j}+\mathrm{k}}(\bmod \mathrm{n}) \tag{11}
\end{equation*}
$$

where $\bmod n$ means modulo $n$. For example, if $n=5$, then
$h_{3} h_{4}=h_{3+4}(\bmod 5)=h_{7}(\bmod 5)=h_{2}$.
The formula(11) allows us to multiply many complex units at once, as follows:
$h_{j 1} h_{j 2} \ldots h_{j p}=h_{j 1+j 2+\ldots+j p}(\bmod n)$, for $p \geq 1$.
The Neutrosophic hyper-complex number of dimension $n$ [12] which is a number and it can be written of the form:
$u+v I$
where $u$ and $v$ are $n$-complex numbers and $I$ is the indeterminacy.

## 3. Rough Neutrosophic Hyper-complex Set in Dimension n

## Definition 3.1

Let Z be a non-null set and R be an equivalence relation on Z . Let A be a neutrosophic hypercomplex set of dimension $n$ (or neutrosophic n-complex number), and its elements of the form $u+v I$, where $u$ and $v$ are n-complex numbers and $I$ is the indeterminacy. The lower and the upper approximations of $A$ in the approximation space ( $Z, R$ ) denoted by $\underline{N}(A)$ and $\overline{\mathrm{N}}(\mathrm{A})$ are respectively defined as follows:

$$
\begin{align*}
& \underline{N}(\mathrm{~A})=\left\langle\left\langle\mathrm{x},[\mathrm{u}+\mathrm{vI}]_{\underline{N}(A)}(\mathrm{x})>/ \mathrm{z} \in[\mathrm{x}]_{\mathrm{R}}, \mathrm{x} \in \mathrm{z}\right\rangle\right.  \tag{15}\\
& \overline{\mathrm{N}}(\mathrm{~A})=\left\langle\left\langle\mathrm{x},[\mathrm{u}+\mathrm{vI}]_{\overline{\mathrm{N}}(\mathrm{~A})}(\mathrm{x})>/ \mathrm{z} \in[\mathrm{x}]_{\mathrm{R}}, \mathrm{x} \in \mathrm{Z}\right\rangle\right. \tag{16}
\end{align*}
$$

where,

$$
\begin{align*}
& {[\mathrm{u}+\mathrm{vI}]_{\underline{N}(\mathrm{~A})}(\mathrm{x})=\wedge_{\mathrm{z}} \in[\mathrm{x}]_{\mathrm{R}}[\mathrm{u}+\mathrm{vI}]_{\mathrm{A}}(\mathrm{z}),}  \tag{17}\\
& {[\mathrm{u}+\mathrm{vI}]_{\overline{\mathrm{N}}(\mathrm{~A})}(\mathrm{x})=\mathrm{V}_{\mathrm{z}} \in[\mathrm{x}]_{\mathrm{R}}[\mathrm{u}+\mathrm{vI}]_{\mathrm{A}}(\mathrm{z})} \tag{18}
\end{align*}
$$

So, $[\mathrm{u}+\mathrm{vI}]_{\underline{N}(A)}(\mathrm{x})$ and $[\mathrm{u}+\mathrm{vI}]_{\bar{N}(A)}(\mathrm{x})$ are neutrosophic hyper-complex numbers of dimension n . Here $\vee$ and $\wedge$ denote ' $m a x$ ' and 'min' operators respectively. $[u+v I]_{A}(z)$ and $[u+v I]_{A}(z)$ are the neutrosophic hyper-complex sets of dimension $n$ of $z$ with respect to $A$. $\underline{N}(A)$ and $\bar{N}(A)$ are two neutrosophic hyper-complex sets of dimension n in Z .

Thus, NS mappings $\underline{N}, \overline{\mathrm{~N}}: N(Z) \rightarrow \mathrm{N}(Z)$ are respectively referred to as the lower and upper rough neutrosophic hyper-complex approximation operators, and the pair (N(A), $\overline{\mathrm{N}}(\mathrm{A})$ ) is called the rough neutrosophic hyper-complex set in $(\mathrm{Z}, \mathrm{R})$.

Based on the above mentioned definition, it is observed that $\underline{N}(A)$ and $\bar{N}(A)$ have constant membership on the equivalence clases of $R$, if $\underline{N}(A)=\bar{N}(A)$; i.e. $[u+v]_{\underline{N}(A)}(x)=$ $[u+v I]_{\bar{N}(A)}(x)$.

## Definition 3.2

Let $N(A)=(\underline{N}(A), \bar{N}(A))$ be a rough neutrosophic hyper-complex set in $(Z, R)$. The rough complement of $N(A)$ is denoted by $\sim N(A)=\left(\underline{N}(A)^{c}, \bar{N}(A)^{c}\right)$, where $\underline{N}(A)^{c}$ and $\bar{N}(A)^{c}$ are the complements of neutrosophic hyper-complex set of $\underline{N}(A)$ and $\bar{N}(A)$ respectively.

$$
\begin{equation*}
\underline{\mathrm{N}}(\mathrm{~A})^{\mathrm{c}}=\left\langle\left\langle\mathrm{x},[\mathrm{u}+\mathrm{v}(1-\mathrm{I})]_{\underline{\mathrm{N}}(\mathrm{~A})}(\mathrm{x})>/, \mathrm{x} \in \mathrm{Z}\right\rangle,\right. \tag{19}
\end{equation*}
$$

and

$$
\begin{equation*}
\overline{\mathrm{N}}(\mathrm{~A})^{\mathrm{c}}=\left\langle\left\langle\mathrm{x},[\mathrm{u}+\mathrm{v}(1-\mathrm{I})]_{\overline{\mathrm{N}}(\mathrm{~A})}(\mathrm{x})>/, \mathrm{x} \in \mathrm{Z}\right\rangle\right. \tag{20}
\end{equation*}
$$

## Definition 3.3

Let $N(A)$ and $N(B)$ are two rough neutrosophic hyper-complex sets respectively in $Z$, then the following definitions hold:

$$
\begin{equation*}
\mathrm{N}(\mathrm{~A})=\mathrm{N}(\mathrm{~B}) \Leftrightarrow \underline{\mathrm{N}}(\mathrm{~A})=\underline{\mathrm{N}}(\mathrm{~B}) \wedge \overline{\mathrm{N}}(\mathrm{~A})=\overline{\mathrm{N}}(\mathrm{~B}) \tag{21}
\end{equation*}
$$

$$
\begin{align*}
& N(A) \subseteq N(B) \Leftrightarrow \underline{N}(A) \subseteq \underline{N}(B) \wedge \bar{N}(A) \subseteq \bar{N}(B)  \tag{22}\\
& N(A) \cup N(B)=\langle\underline{N}(A) \cup \underline{N}(B), \bar{N}(A) \cup \bar{N}(B)\rangle  \tag{23}\\
& N(A) \cap N(B)=\langle\underline{N}(A) \cap \underline{N}(B), \bar{N}(A) \cap \bar{N}(B)\rangle \tag{24}
\end{align*}
$$

If $A, B, C$ are the rough neutrosophic hyper-complex sets in $(Z, R)$, then the following propositions are stated from definitions

## Proposition 1

$$
\begin{align*}
& \text { I. } \sim(\sim A)=A  \tag{25}\\
& \text { II. } \underline{N}(A) \subseteq \bar{N}(B)  \tag{26}\\
& \text { III. }<\sim(\underline{N}(A) \cup \underline{N}(B))=\sim(\underline{N}(A)) \cap \sim(\underline{N}(B))  \tag{27}\\
& \text { IV. }<\sim(\underline{N}(A) \cap \underline{N}(B))=\sim(\underline{N}(A)) \cup \sim(\underline{N}(B))  \tag{28}\\
& \text { V. }<\sim(\overline{\mathrm{N}}(A) \cup \overline{\mathrm{N}}(B))=\sim(\overline{\mathrm{N}}(A)) \cap \sim(\overline{\mathrm{N}}(B))  \tag{29}\\
& \text { VI. }<\sim(\overline{\mathrm{N}}(A) \cap \overline{\mathrm{N}}(B))=\sim(\overline{\mathrm{N}}(A)) \cup \sim(\overline{\mathrm{N}}(B)) \tag{30}
\end{align*}
$$

## Proofs I:

If $N(A)=[\underline{N}(A), \bar{N}(A)]$ is a rough neutrosophic hyper-complex set in $(Z, R)$, the complement of $N(A)$ is the rough neutrosophic hyper-complex set defined as follows.

$$
\begin{equation*}
\underline{\mathrm{N}}(\mathrm{~A})^{\mathrm{c}}=\left\langle\left\langle\mathrm{x},[\mathrm{u}+\mathrm{v}(1-\mathrm{I})]_{\underline{\mathrm{N}}(\mathrm{~A})}(\mathrm{x})>/, \mathrm{x} \in \mathrm{Z}\right\rangle,\right. \tag{31}
\end{equation*}
$$

and

$$
\begin{equation*}
\overline{\mathrm{N}}(\mathrm{~A})^{\mathrm{c}}=\left\langle\left\langle\mathrm{x},[\mathrm{u}+\mathrm{v}(1-\mathrm{I})]_{\overline{\mathrm{N}}(\mathrm{~A})}(\mathrm{x})>/, \mathrm{x} \in \mathrm{Z}\right\rangle\right. \tag{32}
\end{equation*}
$$

From these definitions, we can write:

$$
\begin{equation*}
\sim(\sim \mathrm{A})=\mathrm{A} . \tag{33}
\end{equation*}
$$

## Proof II:

The lower and the upper approximations of $A$ in the approximation space $(Z, R)$ denoted by $\underline{N}(\mathrm{~A})$ and $\overline{\mathrm{N}}(\mathrm{A})$ are respectively defined as follows:

$$
\begin{equation*}
\underline{\mathrm{N}}(\mathrm{~A})^{\mathrm{c}}=\left\langle\left\langle\mathrm{x},[\mathrm{u}+\mathrm{v}(1-\mathrm{I})]_{\underline{\mathrm{N}}(\mathrm{~A})}(\mathrm{x})>/, \mathrm{x} \in \mathrm{Z}\right\rangle,\right. \tag{34}
\end{equation*}
$$

and

$$
\begin{equation*}
\overline{\mathrm{N}}(\mathrm{~A})^{\mathrm{c}}=\left\langle<\mathrm{x},[\mathrm{u}+\mathrm{v}(1-\mathrm{I})]_{\overline{\mathrm{N}}(\mathrm{~A})}(\mathrm{x})>/, \mathrm{x} \in \mathrm{Z}\right\rangle \tag{35}
\end{equation*}
$$

where,
$[\mathrm{u}+\mathrm{vI}]_{\underline{\mathrm{N}}(\mathrm{A})}(\mathrm{x})=\wedge_{\mathrm{z}} \in[\mathrm{x}]_{\mathrm{R}}[\mathrm{u}+\mathrm{vI}]_{\mathrm{A}}(\mathrm{z})$,
$[\mathrm{u}+\mathrm{vI}]_{\overline{\mathrm{N}}(\mathrm{A})}(\mathrm{x})=\mathrm{V}_{\mathrm{z}} \in[\mathrm{x}]_{\mathrm{R}}[\mathrm{u}+\mathrm{vI}]_{\mathrm{A}}(\mathrm{z})$

So,

$$
\begin{equation*}
\underline{\mathrm{N}}(\mathrm{~A}) \subseteq \overline{\mathrm{N}}(\mathrm{~A}) \tag{38}
\end{equation*}
$$

## Proof III:

Consider:

$$
\begin{align*}
& x \in \sim(\underline{N}(A) \cup \underline{N}(B)) \\
& \Rightarrow x \in \sim \underline{N}(A) \text { and } x \in \sim \underline{N}(B) \\
& \Rightarrow x \in \sim(\underline{N}(A)) \cap \sim(\underline{N}(B)) \\
& \Rightarrow x \in \sim(\underline{N}(A)) \cap \sim(\underline{N}(B))  \tag{39}\\
& \Rightarrow \sim(\underline{N}(A) \cup \underline{N}(B)) \subseteq \sim((\underline{N}(A)) \cap \sim(\underline{N}(B))) .
\end{align*}
$$

Again, consider:

$$
\begin{align*}
& y \in \sim((\underline{N}(A)) \cap \sim(\underline{N}(B))) \\
& \Rightarrow y \in \sim \underline{N}(A) \text { or } y \in \sim \underline{N}(B) \\
& \Rightarrow y \in \Rightarrow \sim(\underline{N}(A) \cup \underline{N}(B)) \\
& \Rightarrow \sim(\underline{N}(A) \cup \underline{N}(B)) \supseteq \sim((\underline{N}(A)) \cap \sim(\underline{N}(B))) . \tag{40}
\end{align*}
$$

Hence,

$$
\begin{equation*}
\sim(\underline{N}(A) \cup \underline{N}(B))=\sim((\underline{N}(A)) \cap \sim(\underline{N}(B))) \tag{41}
\end{equation*}
$$

## Proof IV:

Consider:

$$
\begin{align*}
& x \in \sim(\underline{N}(A) \cap \underline{N}(B)) \\
& \Rightarrow x \in \sim \underline{N}(A) \text { or } x \in \sim \underline{N}(B) \\
& \Rightarrow x \in \sim(\underline{N}(A)) \cup \sim(\underline{N}(B)) \\
& \Rightarrow x \in \sim(\underline{N}(A)) \cup \sim(\underline{N}(B)) \\
& \Rightarrow \sim(\underline{N}(A) \cap \underline{N}(B)) \subseteq \sim((\underline{N}(A)) \cup \sim(\underline{N}(B))) \tag{42}
\end{align*}
$$

Again, consider:

$$
\begin{align*}
& y \in \sim((\underline{N}(A)) \cup \sim(\underline{N}(B))) \\
& \Rightarrow y \in \sim \underline{N}(A) \text { and } y \in \sim \underline{N}(B) \\
& \Rightarrow y \in \sim(\underline{N}(A) \cap \underline{N}(B)) \\
& \Rightarrow \sim(\underline{N}(A) \cap \underline{N}(B)) \supseteq \sim((\underline{N}(A)) \cup \sim(\underline{N}(B))) \tag{43}
\end{align*}
$$

Hence,

$$
\begin{equation*}
\sim(\underline{N}(\mathrm{~A}) \cap \underline{N}(\mathrm{~B}))=\sim((\underline{N}(\mathrm{~A})) \cup \sim(\underline{N}(\mathrm{~B}))) \tag{44}
\end{equation*}
$$

## Proof V:

Consider:

$$
\begin{align*}
& x \in \sim(\overline{\mathrm{~N}}(\mathrm{~A}) \cup \overline{\mathrm{N}}(\mathrm{~B})) \\
& \Rightarrow \mathrm{x} \in \sim \overline{\mathrm{~N}}(\mathrm{~A}) \text { and } \mathrm{x} \in \sim \overline{\mathrm{~N}}(\mathrm{~B}) \\
& \Rightarrow \mathrm{x} \in \sim(\overline{\mathrm{~N}}(\mathrm{~A})) \cap \sim(\overline{\mathrm{N}}(\mathrm{~B})) \\
& \Rightarrow \mathrm{x} \in \sim(\overline{\mathrm{~N}}(\mathrm{~A})) \cap \sim(\overline{\mathrm{N}}(\mathrm{~B})) \\
& \Rightarrow \sim(\overline{\mathrm{N}}(\mathrm{~A}) \cup \overline{\mathrm{N}}(\mathrm{~B})) \subseteq \sim((\overline{\mathrm{N}}(\mathrm{~A})) \cap \sim(\overline{\mathrm{N}}(\mathrm{~B}))) \tag{45}
\end{align*}
$$

Again, consider:

$$
\begin{align*}
& \mathrm{y} \in \sim((\overline{\mathrm{~N}}(\mathrm{~A})) \cap \sim(\overline{\mathrm{N}}(\mathrm{~B}))) \\
& \Rightarrow \mathrm{y} \in \sim \overline{\mathrm{~N}}(\mathrm{~A}) \text { or } \mathrm{y} \in \sim \overline{\mathrm{~N}}(\mathrm{~B}) \\
& \Rightarrow \mathrm{y} \in \sim(\overline{\mathrm{~N}}(\mathrm{~A}) \cup \overline{\mathrm{N}}(\mathrm{~B})) \\
& \Rightarrow \sim(\overline{\mathrm{N}}(\mathrm{~A}) \cup \overline{\mathrm{N}}(\mathrm{~B})) \supseteq \sim((\overline{\mathrm{N}}(\mathrm{~A})) \cap \sim(\overline{\mathrm{N}}(\mathrm{~B}))) \tag{46}
\end{align*}
$$

Hence,

$$
\begin{equation*}
\sim(\overline{\mathrm{N}}(\mathrm{~A}) \cup \overline{\mathrm{N}}(\mathrm{~B}))=\sim((\overline{\mathrm{N}}(\mathrm{~A})) \cap \sim(\overline{\mathrm{N}}(\mathrm{~B}))) \tag{47}
\end{equation*}
$$

## Proof VI:

Consider:

$$
\begin{align*}
& \mathrm{x} \in \sim(\overline{\mathrm{~N}}(\mathrm{~A}) \cap \overline{\mathrm{N}}(\mathrm{~B})) \\
& \Rightarrow \mathrm{x} \in \sim \overline{\mathrm{~N}}(\mathrm{~A}) \text { or } \mathrm{x} \in \sim \overline{\mathrm{~N}}(\mathrm{~B}) \\
& \Rightarrow \mathrm{x} \in \sim(\overline{\mathrm{~N}}(\mathrm{~A})) \cup \sim(\overline{\mathrm{N}}(\mathrm{~B})) \\
& \Rightarrow \mathrm{x} \in \sim(\overline{\mathrm{~N}}(\mathrm{~A})) \cup \sim(\overline{\mathrm{N}}(\mathrm{~B})) \\
& \Rightarrow \sim(\overline{\mathrm{N}}(\mathrm{~A}) \cap \overline{\mathrm{N}}(\mathrm{~B})) \subseteq \sim((\overline{\mathrm{N}}(\mathrm{~A})) \cup \sim(\overline{\mathrm{N}}(\mathrm{~B}))) \tag{48}
\end{align*}
$$

Again, consider:

$$
\begin{align*}
& \mathrm{y} \in \sim((\overline{\mathrm{~N}}(\mathrm{~A})) \cup \sim(\overline{\mathrm{N}}(\mathrm{~B}))) \\
& \Rightarrow \mathrm{y} \in \sim \overline{\mathrm{~N}}(\mathrm{~A}) \text { and } \mathrm{y} \in \sim \overline{\mathrm{~N}}(\mathrm{~B}) \\
& \Rightarrow \mathrm{y} \in \sim(\overline{\mathrm{~N}}(\mathrm{~A})) \cap \sim(\overline{\mathrm{N}}(\mathrm{~B})) \\
& \Rightarrow \sim(\overline{\mathrm{N}}(\mathrm{~A}) \cap \overline{\mathrm{N}}(\mathrm{~B})) \supseteq \sim((\overline{\mathrm{N}}(\mathrm{~A})) \cup \sim(\overline{\mathrm{N}}(\mathrm{~B}))) \tag{49}
\end{align*}
$$

Hence,

$$
\begin{equation*}
\sim(\overline{\mathrm{N}}(\mathrm{~A}) \cap \overline{\mathrm{N}}(\mathrm{~B}))=\sim((\overline{\mathrm{N}}(\mathrm{~A})) \cup \sim(\overline{\mathrm{N}}(\mathrm{~B}))) \tag{50}
\end{equation*}
$$

## Proposition 2:

$$
\begin{align*}
& \text { I. } \sim[N(A) \cup N(B)]=(\sim N(A)) \cap(\sim N(B))  \tag{51}\\
& \text { II. } \sim[N(A) \cap N(B)]=(\sim N(A)) \cup(\sim N(B))
\end{align*}
$$

## Proof I:

$$
\begin{align*}
& \sim[N(A) \cup N(B)] \\
& =\sim\langle\underline{N}(A) \cup \underline{N}(B), \bar{N}(A) \cup \bar{N}(B)> \\
& =<\sim(\underline{N}(P) \cap \underline{N}(Q)), \sim(\bar{N}(P) \cap \bar{N}(Q))> \\
& =(\sim N(A)) \cap(\sim N(B)) \tag{53}
\end{align*}
$$

## Proof II:

$$
\begin{align*}
& \sim[N(A) \cap N(B)] \\
& =\sim<\underline{N}(A) \cap \underline{N}(B), \bar{N}(A) \cap \bar{N}(B)> \\
& =<\sim(\underline{N}(A) \cup \underline{N}(B)), \sim(\bar{N}(A) \cup \bar{N}(B))> \\
& =(\sim N(A)) \cup(\sim N(B)) \tag{54}
\end{align*}
$$

## 4. Rough neutrosophic hyper-complex cosine function (RNHCF)

The cosine similarity measure is calculated as the inner product of two vectors divided by the product of their lengths. It is the cosine of the angle between the vector representations of two rough neutrosophic hyper-complex sets. The cosine similarity measure is a fundamental measure used in information technology. Now, a new cosine function between rough neutrosophic hyper-complex sets is proposed as follows.

## Definition 4.1

Assume that there are two rough neutrosophic hyper-complex sets

$$
\begin{equation*}
\mathrm{A}=\left\langle[\mathrm{u}+\mathrm{vI}]_{\underline{N}(\mathrm{~A})}(\mathrm{x}),[\mathrm{u}+\mathrm{vI}]_{\overline{\mathrm{N}}(\mathrm{~A})}(\mathrm{x})\right\rangle \tag{55}
\end{equation*}
$$

and

$$
\begin{equation*}
\mathrm{B}=\left\langle[\mathrm{u}+\mathrm{vI}]_{\underline{\mathrm{N}}(\mathrm{~B})}(\mathrm{x}),[\mathrm{u}+\mathrm{vI}]_{\overline{\mathrm{N}}(\mathrm{~B})}(\mathrm{x})\right\rangle \tag{56}
\end{equation*}
$$

in $X=\left\{x_{1}, x_{2}, \ldots, x_{n}\right\}$.
Then rough neutrosophic hyper-complex cosine function between two sets $A$ and $B$ is defined as follows:
$\mathrm{C}_{\text {RNHCF }}(\mathrm{A}, \mathrm{B})=$

$$
\begin{equation*}
\frac{1}{\mathrm{n}} \sum_{\mathrm{i}=1}^{\mathrm{n}} \frac{\Delta \mathrm{u}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right) \cdot \Delta \mathrm{u}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)+\Delta \mathrm{v}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right) \cdot \Delta \mathrm{v}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)+\Delta \mathrm{I}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right) \cdot \Delta \mathrm{I}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)}{\sqrt{\left(\Delta \mathrm{u}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)\right)^{2}+\left(\Delta \mathrm{v}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)\right)^{2}+\left(\Delta \mathrm{I}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)\right)^{2}} \sqrt{\left(\Delta \mathrm{u}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)\right)^{2}+\left(\Delta \mathrm{v}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)\right)^{2}+\left(\Delta \mathrm{I}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)\right)^{2}}} \tag{57}
\end{equation*}
$$

where,

$$
\begin{align*}
& \Delta \mathrm{u}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)=0.5 \cdot \mid \mathrm{u}_{\underline{\mathrm{N}}(\mathrm{~A})\left(\mathrm{x}_{\mathrm{i}}\right)}+\mathrm{u}_{\overline{\mathrm{N}}(\mathrm{~A})}\left(\mathrm{x}_{\mathrm{i}}\right)  \tag{58}\\
& \Delta \mathrm{u}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)=0.5 \cdot\left|\mathrm{u}_{\underline{\mathrm{N}(\mathrm{~B})\left(\mathrm{x}_{\mathrm{i}}\right)}}+\mathrm{u}_{\overline{\mathrm{N}}(\mathrm{~B})^{\left(\mathrm{x}_{\mathrm{i}}\right)} \mid}\right| \tag{59}
\end{align*}
$$

$$
\begin{align*}
& \Delta \mathrm{v}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)=0.5 .\left.\right|_{\underline{\mathrm{N}}(\mathrm{~A})\left(\mathrm{x}_{\mathrm{i}}\right)}+\mathrm{v}_{\overline{\mathrm{N}}(\mathrm{~A})^{\left(\mathrm{x}_{\mathrm{i}}\right)}} \mid,  \tag{60}\\
& \Delta \mathrm{v}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)=0.5 \cdot\left|\mathrm{v}_{\underline{\mathrm{N}}(\mathrm{~B})\left(\mathrm{x}_{\mathrm{i}}\right)}+\mathrm{v}_{\overline{\mathrm{N}}(\mathrm{~B})}\left(\mathrm{x}_{\mathrm{i}}\right)\right|,  \tag{61}\\
& \Delta \mathrm{I}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)=0.5 .\left|\mathrm{I}_{\underline{\mathrm{N}}(\mathrm{~A})\left(\mathrm{x}_{\mathrm{i}}\right)}+\mathrm{I}_{\overline{\mathrm{N}}(\mathrm{~A})}\left(\mathrm{x}_{\mathrm{i}}\right)\right|,  \tag{62}\\
& \Delta \mathrm{I}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)=0.5 .\left|\mathrm{I}_{\underline{\mathrm{N}}(\mathrm{~B})\left(\mathrm{x}_{\mathrm{i}}\right)}+\mathrm{I}_{\overline{\mathrm{N}}(\mathrm{~B})\left(\mathrm{x}_{\mathrm{i}}\right)}\right| . \tag{63}
\end{align*}
$$

## Proposition 3:

Let $A$ and $B$ be rough neutrosophic sets, then:
I. $0 \leq \mathrm{C}_{\text {RNHCF }}(\mathrm{A}, \mathrm{B}) \leq 1$
II. $\quad \mathrm{C}_{\text {RNHCF }}(\mathrm{A}, \mathrm{B})=\mathrm{C}_{\text {RNHCF }}(\mathrm{B}, \mathrm{A})$
III. $\operatorname{Cr}_{\text {rnhef }}(\mathrm{A}, \mathrm{B})=1$, if and only if $\mathrm{A}=\mathrm{B}$
IV. If C is a RNHC
C) $\leq \mathrm{C}_{\text {вNнсF }}(\mathrm{B}, \mathrm{C})$.

## Proofs:

I. It is obvious because all positive values of cosine function are within 0 and 1
II. It is obvious that the proposition is true.
III. When $\mathrm{A}=\mathrm{B}$, then obviously $\operatorname{Crnhcf}(\mathrm{A}, \mathrm{B})=1$. On the other hand if $\mathrm{C}_{\text {rnhef }}(\mathrm{A}, \mathrm{B})=1$ then, $\Delta \mathrm{T}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)=\Delta \mathrm{T}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right), \Delta \mathrm{I}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)=\Delta \mathrm{I}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right), \Delta \mathrm{F}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)=\Delta \mathrm{F}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right) \mathrm{ie}$,

This implies that $\mathrm{A}=\mathrm{B}$.
IV. If $A \subset B \subset C$, then we can write

$$
\begin{align*}
& \mathrm{u}_{\underline{\mathrm{N}}(\mathrm{~A})}\left(\mathrm{x}_{\mathrm{i}}\right) \leq \mathrm{u}_{\underline{\mathrm{N}}(\mathrm{~B})}\left(\mathrm{x}_{\mathrm{i}}\right) \leq \mathrm{u}_{\underline{\mathrm{N}}(\mathrm{C})}\left(\mathrm{x}_{\mathrm{i}}\right),  \tag{68}\\
& u_{\overline{\mathrm{N}}(\mathrm{~A})}\left(\mathrm{X}_{\mathrm{i}}\right) \leq \mathrm{u}_{\overline{\mathrm{N}}(\mathrm{~B})}\left(\mathrm{x}_{\mathrm{i}}\right) \leq \mathrm{u}_{\overline{\mathrm{N}}(\mathrm{C})}\left(\mathrm{x}_{\mathrm{i}}\right),  \tag{69}\\
& \mathrm{v}_{\mathrm{N}(\mathrm{~A})}\left(\mathrm{x}_{\mathrm{i}}\right) \leq \mathrm{v}_{\mathrm{N}(\mathrm{~B})}\left(\mathrm{x}_{\mathrm{i}}\right) \leq \mathrm{v}_{\mathrm{N}(\mathrm{C})}\left(\mathrm{x}_{\mathrm{i}}\right),  \tag{70}\\
& \mathrm{v}_{\overline{\mathrm{N}}(\mathrm{~A})}\left(\mathrm{x}_{\mathrm{i}}\right) \leq \mathrm{v}_{\overline{\mathrm{N}}(\mathrm{~B})}\left(\mathrm{x}_{\mathrm{i}}\right) \leq \mathrm{v}_{\overline{\mathrm{N}}(\mathrm{C})}\left(\mathrm{x}_{\mathrm{i}}\right) \text {, }  \tag{71}\\
& \mathrm{I}_{\underline{\mathrm{N}}(\mathrm{~A})}\left(\mathrm{x}_{\mathrm{i}}\right) \geq \mathrm{I}_{\underline{\mathrm{N}}(\mathrm{~B})}\left(\mathrm{x}_{\mathrm{i}}\right) \geq \mathrm{I}_{\underline{\mathrm{N}}(\mathrm{C})}\left(\mathrm{x}_{\mathrm{i}}\right),  \tag{72}\\
& \mathrm{I}_{\overline{\mathrm{N}}(\mathrm{~A})}\left(\mathrm{x}_{\mathrm{i}}\right) \geq \mathrm{I}_{\overline{\mathrm{N}}(\mathrm{~B})}\left(\mathrm{x}_{\mathrm{i}}\right) \geq \mathrm{I}_{\overline{\mathrm{N}}(\mathrm{C})}\left(\mathrm{x}_{\mathrm{i}}\right) \tag{73}
\end{align*}
$$

The cosine function is decreasing function within the interval $\left[0, \frac{\pi}{2}\right]$. Hence we can write

If we consider the weight of each element $\mathrm{x}_{\mathrm{i}}$, a weighted rough neutrosophic hyper-complex cosine function (WRNHCF) between two sets A and B can be defined as follows:
$\mathrm{C}_{\text {WRNHCF }}(\mathrm{A}, \mathrm{B})=$

$$
\begin{equation*}
\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{~W}_{\mathrm{i}} \frac{\Delta \mathrm{u}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right) \cdot \Delta \mathrm{u}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)+\Delta \mathrm{v}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right) \cdot \Delta \mathrm{v}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)+\Delta \mathrm{I}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right) \cdot \Delta \mathrm{I}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)}{\sqrt{\left(\Delta \mathrm{u}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)\right)^{2}+\left(\Delta \mathrm{v}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)\right)^{2}+\left(\Delta \mathrm{I}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)\right)^{2}} \sqrt{\left(\Delta \mathrm{u}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)\right)^{2}+\left(\Delta \mathrm{v}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)\right)^{2}+\left(\Delta \mathrm{I}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)\right)^{2}}} \tag{74}
\end{equation*}
$$

where,

$$
\begin{align*}
& \Delta \mathrm{u}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)=0.5 .\left|\mathrm{u}_{\underline{\mathrm{N}}(\mathrm{~A})\left(\mathrm{x}_{\mathrm{i}}\right)}+\mathrm{u}_{\overline{\mathrm{N}}(\mathrm{~A})}{ }^{\left(\mathrm{x}_{\mathrm{i}}\right)}\right|,  \tag{75}\\
& \Delta \mathrm{u}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)=0.5 \cdot\left|\mathrm{u}_{\underline{\mathrm{N}(\mathrm{~B})\left(\mathrm{X}_{\mathrm{i}}\right)}}+\mathrm{u}_{\overline{\mathrm{N}}(\mathrm{~B})^{\left(\mathrm{x}_{\mathrm{i}}\right)}}\right|,  \tag{76}\\
& \Delta \mathrm{v}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)=0.5 .\left.\right|_{\underline{\mathrm{N}(\mathrm{~A})\left(\mathrm{x}_{\mathrm{i}}\right)}}+\mathrm{v}_{\overline{\mathrm{N}}(\mathrm{~A})}{ }^{\left(\mathrm{x}_{\mathrm{i}}\right)} \mid,  \tag{77}\\
& \Delta \mathrm{v}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)=0.5 .\left|\mathrm{v}_{\underline{\mathrm{N}}(\mathrm{~B})\left(\mathrm{x}_{\mathrm{i}}\right)}+\mathrm{v}_{\overline{\mathrm{N}}(\mathrm{~B})\left(\mathrm{x}_{\mathrm{i}}\right)}\right|,  \tag{78}\\
& \Delta \mathrm{I}_{\mathrm{A}}\left(\mathrm{x}_{\mathrm{i}}\right)=0.5 \cdot\left|\mathrm{I}_{\underline{\mathrm{N}}(\mathrm{~A})\left(\mathrm{x}_{\mathrm{i}}\right)}+\mathrm{I}_{\overline{\mathrm{N}}(\mathrm{~A})^{\left(\mathrm{x}_{\mathrm{i}}\right)}}\right|, \tag{79}
\end{align*}
$$

$$
\begin{equation*}
\Delta \mathrm{I}_{\mathrm{B}}\left(\mathrm{x}_{\mathrm{i}}\right)=0.5 .\left|\mathrm{I}_{\underline{\mathrm{N}}(\mathrm{~B})\left(\mathrm{x}_{\mathrm{i}}\right)}+\mathrm{I}_{\overline{\mathrm{N}}(\mathrm{~B})} \mathrm{x}_{\mathrm{i})}\right| \tag{80}
\end{equation*}
$$

$\mathrm{W}_{\mathrm{i}} \in[0,1], \mathrm{i}=1,2, \ldots, \mathrm{n}$ and $\sum_{\mathrm{i}=1}^{\mathrm{n}} \mathrm{W}_{\mathrm{i}}=1$.
If we take $\mathrm{W}_{\mathrm{i}}=\frac{1}{\mathrm{n}}, \mathrm{i}=1,2, \ldots, \mathrm{n}$, then:
Cwrnhcf $(\mathrm{A}, \mathrm{B})=\mathrm{C}_{\text {Rnhcf }}(\mathrm{A}, \mathrm{B})$
The weighted rough neutrosophic hyper-complex cosine function (WRNHCF) between two rough neutrosophic hyper-complex sets $A$ and $B$ also satisfies the following properties:
I. $0 \leq \mathrm{C}_{\text {WRNHCF }}(\mathrm{A}, \mathrm{B}) \leq 1$
II. $\mathrm{C}_{\text {WRNHCF }}(\mathrm{A}, \mathrm{B})=\mathrm{C}_{\text {WRNHCF }}(\mathrm{B}, \mathrm{A})$
III. $\left.\operatorname{Cwrnhef~}^{\text {( }} \mathrm{A}, \mathrm{B}\right)=1$, if and only if $\mathrm{A}=\mathrm{B}$
IV. If C is a WRNHCF in Y and $\mathrm{A} \subset \mathrm{B} \subset \mathrm{C}$ then, $\mathrm{C}_{\text {wrnhef }}(\mathrm{A}, \mathrm{C}) \leq \mathrm{C}_{\text {wrnhcf }}(\mathrm{A}, \mathrm{B})$, and $\mathrm{C}_{\text {WRnhcF }}(\mathrm{A}, \mathrm{C}) \leq \mathrm{C}_{\text {Wrnhef }}(\mathrm{B}, \mathrm{C})$

## 5. Decision making procedure based on rough hyper-complex neutrosophic

## function

In this section, we apply rough neutrosophic hyper-complex cosine function to the multiattribute decision making problem. Let $\mathrm{A}_{1}, \mathrm{~A}_{2}, \ldots, \mathrm{~A}_{\mathrm{m}}$ be a set of alternatives and $\mathrm{C}_{1}, \mathrm{C}_{2}, \ldots, \mathrm{C}_{\mathrm{n}}$ be a set of attributes.

The proposed multi attribute decision making approach is described using the following steps.

## Step1: Construction of the decision matrix with rough neutrosophic hyper-complex numbers

The decision maker considers a decision matrix with respect to $m$ alternatives and $n$ attributes in terms of rough neutrosophic hyper-complex numbers as follows.

Table1: Rough neutrosophic hyper-complex decision matrix

$$
\begin{align*}
& \mathrm{DM}=\left\langle\underline{\mathrm{dm}_{\mathrm{ij}}, \overline{\mathrm{dm}}_{\mathrm{ij}}}\right\rangle_{\mathrm{m} \times \mathrm{n}}= \\
& \begin{array}{c|cccc} 
& C_{1} & C_{2} & \ldots & C_{n} \\
\hline \mathrm{~A}_{1} & \left\langle\underline{\mathrm{dm}}_{11}, \overline{\mathrm{dm}}_{11}\right\rangle & \left\langle\underline{\mathrm{dm}}_{12}, \overline{\mathrm{~mm}}_{12}\right\rangle & \ldots & \left\langle\underline{\mathrm{dm}}_{1 \mathrm{n}}, \overline{\mathrm{~mm}_{1 n}}\right\rangle
\end{array} \\
& \mathrm{A}_{2}\left\langle\left\langle\underline{\mathrm{dm}}_{21}, \overline{\mathrm{dm}}_{21}\right\rangle \quad\left\langle\underline{\mathrm{dm}}_{22}, \overline{\mathrm{dm}}_{22}\right\rangle \quad \ldots \quad\left\langle\underline{\mathrm{dm}}_{2 \mathrm{n}}, \overline{\mathrm{dm}}_{2 \mathrm{n}}\right\rangle\right.  \tag{86}\\
& \begin{array}{ccccc}
A_{m} & \cdots & \cdots & \cdots & \cdots \\
\left\langle\underline{d m}_{m 1}, \overline{d m}_{m 1}\right\rangle & \left.\cdots \underline{d m}_{m 2}, \overline{d m}_{m 2}\right\rangle & \cdots & \left.\cdots \underline{d m}_{m n}, \overline{d m}_{m n}\right\rangle
\end{array}
\end{align*}
$$

Here $\left\langle\underline{\mathrm{dm}_{i \mathrm{i}}}, \overline{\mathrm{dm}}_{\mathrm{ij}}\right\rangle$ is the rough neutrosophic hyper-complex number according to the i-th alternative and the j -th attribute.

## Step2: Determination of the weights of the attributes

Assume that the weight of the attribute $\mathrm{C}_{\mathrm{j}}(\mathrm{j}=1,2, \ldots, n)$ considered by the decision-maker be $\mathrm{w}_{\mathrm{j}}(\mathrm{j}=1,2, \ldots, n)$ such that $\forall \mathrm{w}_{\mathrm{j}} \in[0,1](\mathrm{j}=1,2, \ldots, \mathrm{n})$ and $\sum_{\mathrm{j}=1}^{\mathrm{n}} \mathrm{w}_{\mathrm{j}}=1$.

Step 3: Determination of the benefit type attribute and cost type attribute

Generally, the evaluation of attributes can be categorized into two types: benefit attribute and cost attribute. Let $K$ be a set of benefit attributes and $M$ be a set of cost attributes. In the proposed decision-making approach, an ideal alternative can be identified by using a maximum operator for the benefit attribute and a minimum operator for the cost attribute to determine the best value of each criterion among all alternatives. Therefore, we define an ideal alternative as follows.

$$
\begin{equation*}
A^{*}=\left\{\mathrm{C}_{1}{ }^{*}, \mathrm{C}_{2}{ }^{*}, \ldots, \mathrm{C}_{\mathrm{m}}{ }^{*}\right\} \tag{87}
\end{equation*}
$$

Benefit attribute:

$$
\begin{equation*}
\mathrm{C}_{\mathrm{j}}^{*}=\left[\max _{\mathrm{i}} \mathrm{u}_{\mathrm{C}_{\mathrm{j}}}{ }^{\left(\mathrm{A}_{\mathrm{i}}\right)}, \max _{\mathrm{i}}{ }_{\mathrm{V}_{\mathrm{C}}}{ }^{\left(\mathrm{A}_{\mathrm{i}}\right)}, \min _{\mathrm{i}}{ }_{\mathrm{C}_{\mathrm{j}}}{ }^{\left(\mathrm{A}_{\mathrm{i}}\right)}\right] \tag{88}
\end{equation*}
$$

Cost attribute:

$$
\begin{equation*}
\mathrm{C}_{\mathrm{j}}^{*}=\left[\min _{\mathrm{i}} \mathrm{~T}_{\mathrm{C}_{\mathrm{j}}}^{\left(\mathrm{A}_{\mathrm{i}}\right)}, \min _{\mathrm{i}} \mathrm{I}_{\mathrm{C}_{\mathrm{j}}}^{\left(\mathrm{A}_{\mathrm{i}}\right)}, \max _{\mathrm{i}} \mathrm{~F}_{\mathrm{C}_{\mathrm{j}}}{ }^{\left(\mathrm{A}_{\mathrm{i}}\right)}\right] \tag{89}
\end{equation*}
$$

where,

$$
\begin{align*}
& \left.\mathrm{u}_{\mathrm{C}_{\mathrm{j}}}{ }^{\left(\mathrm{A}_{\mathrm{i}}\right)}=0.5 \cdot \mid\left(\mathrm{u}_{\mathrm{C}_{\mathrm{j}}}\right)_{\underline{\mathrm{N}}\left(\mathrm{~A}_{\mathrm{i}}\right.}\right)+\left(\mathrm{u}_{\mathrm{C}_{\mathrm{j}}}\right)_{\overline{\mathrm{N}}\left(\mathrm{~A}_{\mathrm{i}}\right)} \mid,  \tag{90}\\
& \mathrm{v}_{\mathrm{C}_{\mathrm{j}}}{ }^{\left(\mathrm{A}_{\mathrm{i}}\right)}=0.5 \cdot\left|\left(\mathrm{v}_{\mathrm{C}_{\mathrm{j}}}\right)_{\underline{\mathrm{N}}\left(\mathrm{~A}_{\mathrm{i}}\right)}+\left(\mathrm{v}_{\mathrm{C}_{\mathrm{j}}}\right)_{\overline{\mathrm{N}}\left(\mathrm{~A}_{\mathrm{i}}\right)}\right|, \tag{91}
\end{align*}
$$

and

$$
\begin{equation*}
\left.\mathrm{I}_{\mathrm{C}_{\mathrm{j}}}{ }^{\left(\mathrm{A}_{\mathrm{i}}\right)}=0.5 .5\left(\mathrm{I}_{\mathrm{C}_{\mathrm{j}}}\right)_{\mathbb{N}\left(\mathrm{A}_{\mathrm{i}}\right)}+\left(\mathrm{I}_{\mathrm{C}_{\mathrm{j}}}\right)_{\mathbb{N}\left(\mathrm{A}_{\mathrm{i}}\right)}\right) . \tag{92}
\end{equation*}
$$

## Step4: Determination of the over all weighted rough hyper-complex neutrosophic cosine function (WRNHCF) of the alternatives

Weighted rough neutrosophic hyper-complex cosine function is given as follows.

$$
\begin{equation*}
\mathrm{C}_{\text {WRNHCF }}(\mathrm{A}, \mathrm{~B})=\sum_{\mathrm{j}=1}^{\mathrm{n}} \mathrm{~W}_{\mathrm{j}} \mathrm{C}_{\mathrm{WRNHCF}}(\mathrm{~A}, \mathrm{~B}) \tag{93}
\end{equation*}
$$

## Step5: Ranking the alternatives

Using the weighted rough hyper-complex neutrosophic cosine function between each alternative and the ideal alternative, the ranking order of all alternatives can be determined and the best alternative can be easily selected with the highest similarity value.

Step6: End

## 6. Numerical Example

Assume that a decision maker (an adult man/woman who eligible to marrage) intends to select the most suitable life partner for arrange marrage from the three initially chosen candidates $\left(\mathrm{S}_{1}, \mathrm{~S}_{2}, \mathrm{~S}_{3}\right)$ by considering five attributes namely: physical and mental health $\mathrm{C}_{1}$, education and job $\mathrm{C}_{2}$, management power $\mathrm{C}_{3}$, family background $\mathrm{C}_{4}$, risk factor $\mathrm{C}_{5}$. Based on the proposed approach discussed in section 5, the considered problem has been solved using the following steps:

## Step1: Construction of the decision matrix with rough neutrosophic hyper-complex numbers

The decision maker considers a decision matrix with respect to three alternatives and five attributes in terms of rough neutrosophic hyper-complex numbers shown in the Table 2.

Table2. Decision matrix with rough neutrosophic hyper-complex number

$$
\begin{aligned}
& \mathrm{DM}=\left\langle\underline{\mathrm{dm}}_{\mathrm{ij}}, \overline{\mathrm{dm}}_{\mathrm{ij}}\right\rangle_{3 \times 5}=
\end{aligned}
$$

Where, $\mathrm{i}=\sqrt{-1}$

## Step 2: Determination of the weights of the attributes

The weight vectors considered by the decision maker are $0.25,0.20,0.25,0.10$, and 0.20 respectively.

## Step 3: Determination of the benefit attribute and cost attribute

Here four benefit type attributes are $\mathrm{C}_{1}, \mathrm{C}_{2}, \mathrm{C}_{3}, \mathrm{C}_{4}$ and one cost type attribute is $\mathrm{C}_{5}$. Using equations (12) and (13) we calculate $\mathrm{A}^{*}$ as follows.
$A^{*}=[(5.00,2.69,0.45),(4.47,5.50,0.50),(3.60,2.83,0.25),(6.40,5.30,0.45),(3.16,2.24$, 0.80)]

## Step 4: Determination of the over all weighted rough hyper-complex neutrosophic similarity function (WRHNSF) of the alternatives

We calculate weighted rough neutrosophic hyper-complex similarity values as follows.
$\operatorname{Swrhcf}\left(\mathrm{A}_{1}, \mathrm{~A}^{*}\right)=0.9622$
$\operatorname{SWRHCF}\left(\mathrm{A}_{2}, \mathrm{~A}^{*}\right)=0.9404$
$\left.\operatorname{Swrhcf(A3,~} \mathrm{A}^{*}\right)=0.9942$

## Step 5: Ranking the alternatives

Ranking of the alternatives is prepared based on the descending order of similarity measures. Highest value reflects the best alternative.
Here,
$\operatorname{SWRHCF}\left(\mathrm{A}_{3}, \mathrm{~A}^{*}\right) \succ \operatorname{SWRHCF}\left(\mathrm{A}_{1}, \mathrm{~A}^{*}\right) \succ \operatorname{SWRHCF}\left(\mathrm{A}_{2}, \mathrm{~A}^{*}\right)$
Hence, the decision maker must choose the candidate $A_{3}$ as the best alternative for arrange marriage.
Step 6: End

## 7 Conclusion

In this paper, we have proposed rough neutrosophic hyper-complex set and rough neutrosophic hyper-complex cosine function and proved some of their basic properties. We have also proposed rough neutrosophic hyper-complex similarity measure based multiattribute decision making approach. We have presented an application, namely selection of best candidate for arrange marriage for indian context. The concept presented in this paper can be applied for other multiple attribute decision making problems in rough neutrosophic hyper-complex environment.
