# Neutrosophic Crisp Probability Theory \& Decision Making Process 

#### Abstract

Since the world is full of indeterminacy, the neutrosophics found their place into contemporary research. In neutrosophic set, indeterminacy is quantified explicitly and truth-membership, indeterminacy-membership and falsity-membership are independent. So it is natural to adopt for that purpose the value from the selected set with highest degree of truth-membership, indeterminacy membership and least degree of falsity-membership on the decision set. These factors indicate that a decision making process takes place in neutrosophic environment. In this paper, we introduce and study the probability of neutrosophic crisp sets. After given the fundamental definitions and operations, we obtain several properties and discussed the relationship between them. These notions can help researchers and make great use of it in the future in making algorithms to solving problems and manage between these notions to produce a new application or new algorithm of solving decision support problems. Possible applications to mathematical computer sciences are touched upon.

## Keywords

Neutrosophic set, neutrosophic probability, neutrosophic crisp sets, intuitionistic neutrosophic set.

## 1. Introduction

Neutrosophy has laid the foundation for a whole family of new mathematical theories generalizing both their classical and fuzzy counterparts $[1,2,3,22,23,24,25,26,27,28,29,30$, $31,32,33,34,35,36,42]$ such as a neutrosophic set theory. The fundamental concepts of neutrosophic set, introduced by Smarandache in [48, 49, 50, 51], and Salama et al. in [4, 5, 6, 7, 8, $9,10,11,12,13,14,15,16,17,18,19,20,21]$, provides a natural foundation for treating mathematically the neutrosophic phenomena which exist pervasively in our real world and for building new branches of neutrosophic mathematics. In this paper is to introduce and study the probability of neutrosophic crisp sets. After given the fundamental definitions and operations, we obtain several properties, and discussed the relationship between neutrosophic crisp sets and others.

## 2. Terminologies

We recollect some relevant basic preliminaries, and in particular, the work of Smarandache in [37, 38, 39, 40], and Salama et al. [4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21]. Smarandache introduced the neutrosophic components T, I, F which represent the membership, indeterminacy, and non-membership values respectively, where $] 0,1^{+}[$is nonstandard unit interval.

Example 2.1 [37, 39]
Let us consider a neutrosophic set a collection of possible locations (position) of particle $x$ and Let A and B two neutrosophic sets. One can say, by language abuse, that any particle x neutrosophically belongs to any set, due to the percentages of truth/indeterminacy/falsity involved, which varies between ${ }^{-} 0$ and $1^{+}$.For example $: x(0.5,0.2,0.3)$ belongs to $A$ (which means, the probability of $50 \%$ particle $x$ is in a poison of A, with a probability of $30 \% x$ is not in A, and the rest is undecidable); or $y(0,0,1)$ belongs to $A$ ( which normally means $y$ is not for sure in $A$ ); or $\mathrm{z}(0,1,0)$ belongs to A (which means one does know absolutely nothing about z affiliation with A ). More general, $\mathrm{x}((0.2-0.3),(0.4-0.45) \cup[0.50-0.51],\{0.2,0.24,0.28\})$ belongs to the seta, which means: With a probability in between $20-30 \%$ particle x is in a position of A (one cannot find an exact approximate because of various sources used ); With a probability of $20 \%$ or $24 \%$ or $28 \% \mathrm{x}$ is not in A; The indeterminacy related to the appurtenance of $x$ to $A$ is in between $40-45 \%$ or between $50-51 \%$ ( limits included ). The subsets representing the appurtenance, indeterminacy, and falsity may overlap, and $n$-sup $=30 \%+51 \%+28 \%>100$ in this case.

Definition 2.1 [14, 15, 21]
A neutrosophic crisp set (NCS for short) $A=\left\langle A_{1}, A_{2}, A_{3}\right\rangle$ can be identified to an ordered triple $\left\langle A_{1}, A_{2}, A_{3}\right\rangle$ are subsets on X , and every crisp set in X is obviously an NCS having the form $\left\langle A_{1}, A_{2}, A_{3}\right\rangle$,

Definition 2.2 [21]
The object having the form $A=\left\langle A_{1}, A_{2}, A_{3}\right\rangle$ is called
(Neutrosophic Crisp Set with Type I) If satisfying $A_{1} \cap A_{2}=\phi, A_{1} \cap A_{3}=\phi$ and $A_{2} \cap A_{3}=\phi$. (NCS-Type I for short).
(Neutrosophic Crisp Set with Type II) If satisfying $A_{1} \cap A_{2}=\phi, A_{1} \cap A_{3}=\phi$ and $A_{2} \cap A_{3}=\phi$ and $A_{1} \cup A_{2} \cup A_{3}=X$. (NCS-Type II for short).
(Neutrosophic Crisp Set with Type III) If satisfying, $A_{1} \cap A_{2} \cap A_{3}=\phi$ and $A_{1} \cup A_{2} \cup A_{3}=X$. (NCS-Type III for short).

## Definition 2.3

1) (Neutrosophic Set [7]): Let X be a non-empty fixed set. A neutrosophic set ( NS for short) $A$ is an object having the form $A=\left\langle\mu_{A}(x), \sigma_{A}(x), v_{A}(x)\right\rangle$ where $\mu_{A}(x), \sigma_{A}(x)$ and $v_{A}(x)$ which represent the degree of member ship function (namely $\mu_{A}(x)$ ), the degree of indeterminacy
(namely $\sigma_{A}(x)$ ), and the degree of non-member ship (namely $v_{A}(x)$ ) respectively of each element $x \in X$ to the set $A$ where $0^{-} \leq \mu_{A}(x), \sigma_{A}(x), v_{A}(x) \leq 1^{+} \quad$ and $0^{-} \leq \mu_{A}(x)+\sigma_{A}(x)+v_{A}(x) \leq 3^{+}$.
2) (Neutrosophic Intuitionistic Set of Type 1 [8]): Let $X$ be a non-empty fixed set. A neutrosophic intuitionistic set of type 1 (NIS1 for short) set $A$ is an object having the form $A=\left\langle\mu_{A}(x), \sigma_{A}(x), v_{A}(x)\right\rangle$ where $\mu_{A}(x), \sigma_{A}(x)$ and $v_{A}(x)$ which represent the degree of member ship function (namely $\mu_{A}(x)$ ), the degree of indeterminacy (namely $\sigma_{A}(x)$ ), and the degree of non-membership (namely $v_{A}(x)$ ) respectively of each element $x \in X$ to the set $A$ where $0^{-} \leq \mu_{A}(x), \sigma_{A}(x), v_{A}(x) \leq 1^{+}$and the functions satisfy the condition $\mu_{A}(x) \wedge \sigma_{A}(x) \wedge v_{A}(x) \leq 0.5$ and $0^{-} \leq \mu_{A}(x)+\sigma_{A}(x)+v_{A}(x) \leq 3^{+}$.
3) (Neutrosophic Intuitionistic Set of Type 2 [41]). Let $X$ be a non-empty fixed set. A neutrosophic intuitionistic set of type $2 A$ (NIS2 for short) is an object having the form $A=\left\langle\mu_{A}(x), \sigma_{A}(x), v_{A}(x)\right\rangle$ where $\mu_{A}(x), \sigma_{A}(x)$ and $v_{A}(x)$ which represent the degree of member ship function (namely $\mu_{A}(x)$ ), the degree of indeterminacy (namely $\sigma_{A}(x)$ ), and the degree of non-membership (namely $v_{A}(x)$ ) respectively of each element $x \in X$ to the set $A$ where $0.5 \leq \mu_{A}(x), \sigma_{A}(x), v_{A}(x)$ and the functions satisfy the condition $\mu_{A}(x) \wedge \sigma_{A}(x) \leq 0.5$, $\mu_{A}(x) \wedge v_{A}(x) \leq 0.5, \sigma_{A}(x) \wedge v_{A}(x) \leq 0.5, \quad$ and $\quad-0 \leq \mu_{A}(x)+\sigma_{A}(x)+v_{A}(x) \leq 2^{+} \quad$. A neutrosophic crisp with three types the object $A=\left\langle A_{1}, A_{2}, A_{3}\right\rangle$ can be identified to an ordered triple $\left\langle A_{1}, A_{2}, A_{3}\right\rangle$ are subsets on X , and every crisp set in X is obviously a NCS having the form $\left\langle A_{1}, A_{2}, A_{3}\right\rangle$. Every neutrosophic set $A=\left\langle\mu_{A}(x), \sigma_{A}(x), v_{A}(x)\right\rangle$ on $X$ is obviously on NS having the form $\left\langle\mu_{A}(x), \sigma_{A}(x), \nu_{A}(x)\right\rangle$.

Salama et al. in $[14,15,21]$ constructed the tools for developed neutrosophic crisp set, and introduced the NCS $\phi_{N}, X_{N}$ in X.

## Remark 2.1

i) The neutrosophic intuitionistic set is a neutrosophic set but the neutrosophic set is not in general a neutrosophic intuitionistic set in general.
ii)Neutrosophic crisp sets with three types are neutrosophic crisp set.

## 3. The Probability of Neutrosophic Crisp Sets

If an experiment produces indeterminacy, that is called a neutrosophic experiment. Collecting all results, including the indeterminacy, we get the neutrosophic sample space (or the neutrosophic probability space) of the experiment. The neutrosophic power set of the neutrosophic sample space is formed by all different collections (that may or may not include the indeterminacy) of possible results. These collections are called neutrosophic events. In classical experimental the probability is $\left(\frac{\text { number of times event A occurs }}{\text { totel number of trials }}\right)$. Similarly, Smarandache [16, 17, 18] introduced neutrosophic experimental probability as follows:
$\left(\frac{\text { number of times event A occurs }}{\text { total number of trials }}, \frac{\text { number of times indeterminacy occurs }}{\text { total number of trials }}, \frac{\text { number of times event A does not occur }}{\text { total number of trials }}\right)$
Probability of NCS is a generalization of the classical probability in which the chance that event $A=\left\langle A_{1}, A_{2}, A_{3}\right\rangle$ occurs is: $P\left(A_{1}\right)$ true, $P\left(A_{2}\right)$ indeterminate, $P\left(A_{3}\right)$ false, on a sample space X , or $N P(A)=\left\langle P\left(A_{1}\right), P\left(A_{2}\right), P\left(A_{3}\right)\right\rangle$.

A subspace of the universal set, endowed with a neutrosophic probability defined for each of its subset, forms a probability neutrosophic crisp space.

## Definition 3.1

Let X be a non- empty set and A be any type of neutrosophic crisp set on a space X , then the probability is a mapping $N P: X \rightarrow[0,1]^{3}, N P(A)=\left\langle P\left(A_{1}\right), P\left(A_{2}\right), P\left(A_{3}\right)\right\rangle$ that is the probability a neutrosophic crisp set has the property that, $\operatorname{NP}(\mathrm{A})=\left\{\begin{array}{ll}\left(\mathrm{p}_{1}, \mathrm{p}_{2}, \mathrm{p}_{3}\right) & \text { where } \mathrm{p}_{1,2,3} \in[0,1] \\ 0 & \text { if } \mathrm{p}_{1}, \mathrm{p}_{2}, \mathrm{p}_{3}<0\end{array}\right.$,

## Remark 3.1

i) In case if $A=\left\langle A_{1}, A_{2}, A_{3}\right\rangle$ is NCS then ${ }^{-} 0 \leq P\left(A_{1}\right)+P\left(A_{2}\right)+P\left(A_{3}\right) \leq 3^{+}$
ii) In case if $A=\left\langle A_{1}, A_{2}, A_{3}\right\rangle$ is NCS-Type I then $0 \leq P\left(A_{1}\right)+P\left(A_{2}\right)+P\left(A_{3}\right) \leq 2$.
iii)The probability of NCS-Type II is a neutrosophic crisp set where

$$
{ }^{-} 0 \leq P\left(A_{1}\right)+P\left(A_{2}\right)+P\left(A_{3}\right) \leq 2^{+}
$$

iv) The probability of NCS-Type III is a neutrosophic crisp set where

$$
{ }^{-} 0 \leq P\left(A_{1}\right)+P\left(A_{2}\right)+P\left(A_{3}\right) \leq 3^{+} .
$$

## Probability Axioms of NCS

## Axioms:

1- The probability of neutrosophic crisp set and NCS-Type III A on X

$$
N P(A)=\left\langle P\left(A_{1}\right), P\left(A_{2}\right), P\left(A_{3}\right)\right\rangle \text { where } P\left(A_{1}\right) \geq 0, P\left(A_{2}\right) \geq 0, P\left(A_{3}\right) \geq 0 \text { or }
$$

$$
N P(A)=\left\{\begin{array}{lr}
\left(p_{1}, p_{2}, p_{3}\right) \text { where } p_{1,2,3} \in[0,1] \\
0 & \text { if } p_{1}, p_{2}, p_{3}<o
\end{array}\right.
$$

2- The probability of neutrosophic crisp set and NCS-Type Ills A on X

$$
N P(A)=\left\langle P\left(A_{1}\right), P\left(A_{2}\right), P\left(A_{3}\right)\right\rangle \text { where }^{-} 0 \leq p\left(A_{1}\right)+p\left(A_{2}\right)+p\left(A_{3}\right) \leq 3^{+} .
$$

3- Bonding the probability of neutrosophic crisp set and NCS-Type Ills

$$
N P(A)=\left\langle P\left(A_{1}\right), P\left(A_{2}\right), P\left(A_{3}\right)\right\rangle \text { where } 1 \geq P\left(A_{1}\right) \geq 0, P\left(A_{2}\right) \geq 0, P\left(A_{3}\right) \geq 0 .
$$

4- Addition law for any two neutrosophic crisp sets or NCS-Type III

$$
\begin{align*}
& N P(A \cup B)=<\left(P\left(A_{1}\right)+P\left(B_{1}\right)-P\left(A_{1} \cap B_{1}\right),\left(P\left(A_{2}\right)+P\left(B_{2}\right)-P\left(A_{2} \cap B_{2}\right),\right.\right. \\
& \left(P\left(A_{3}\right)+P\left(B_{3}\right)-P\left(A_{3} \cap B_{3}\right)>\right.
\end{align*}
$$

$$
\begin{aligned}
& \text { if } A \cap B=\phi_{N} \text {, then } N P(A \cap B)=N P\left(\phi_{N}\right) \text {. } \\
& N P(A \cup B)=<N P\left(A_{1}\right)+N P\left(B_{1}\right)-N P\left(\phi_{N_{1}}\right), N P\left(A_{2}\right)+N P\left(B_{2}\right)-N P\left(\phi_{N_{2}}\right) \text {, } \\
& N P\left(A_{3}\right)+N P\left(B_{3}\right)-N P\left(\phi_{N_{3}}\right) \text {. }
\end{aligned}
$$

Since our main purpose is to construct the tools for developing probability of neutrosophic crisp sets, we must introduce the following:

1) Probability of neutrosophic crisp empty set with three types ( $N P\left(\phi_{N}\right)$ for short) may be defined as four types:
i) Type 1: $N P\left(\phi_{N}\right)=\langle P(\phi), P(\phi), P(X)\rangle=\langle 0,0,1\rangle$
ii) Type 2: $N P\left(\phi_{N}\right)=\langle P(\phi), P(X), P(X)\rangle=\langle 0,1,1\rangle$
i) Type 3: $N P\left(\phi_{N}\right)=\langle P(\phi), P(\phi), P(\phi)\rangle=\langle 0,0,0\rangle$
ii) Type 4: $N P\left(\phi_{N}\right)=\langle P(\phi), P(X), P(\phi)\rangle=\langle 0,1,0\rangle$
2) Probability of neutrosophic crisp universal and NCS-Type III universal sets ( $N P\left(X_{N}\right)$ ) may be defined as four types:
i)Type 1: $N P\left(X_{N}\right)=\langle P(X), P(\phi), P(\phi)\rangle=<1,0,0>$
ii) Type 2: $\left.N P\left(X_{N}\right)=\langle P(X), P(X), P(\phi)\rangle=<1,1,0\right\rangle$
iii) Type 3: $N P\left(X_{N}\right)=\langle P(X), P(X), P(X)\rangle=<1,1,1>$
iv) Type 4: $N P\left(X_{N}\right)=\langle P(X), P(\phi), P(X)\rangle=<1,0,1>$

## Remark 3.1

1) $N P\left(X_{N}\right)=1_{N}, N P\left(\phi_{N}\right)=O_{N}$.Where $1_{N}, O_{N}$ are in Definition 2.1 [6], or equals any type for $1_{N}$.
2) The probability of neutrosophic crisp set is a neutrosophic set.

## Definition 3.2 (Monotonicity)

Let $X$ be a non-empty set, and NCSS $A$ and $B$ in the form $A=\left\langle A_{1}, A_{2}, A_{3}\right\rangle, B=\left\langle B_{1}, B_{2}, B_{3}\right\rangle$ with $N P(A)=\left\langle P\left(A_{1}\right), P\left(A_{2}\right), P\left(A_{3}\right)\right\rangle, N P(B)=\left\langle P\left(B_{1}\right), P\left(B_{2}\right), P\left(B_{3}\right)\right\rangle$ then we may consider two possible definitions for subsets ( $A \subseteq B$ )
( $A \subseteq B$ ) may be defined as two types:

1) Type1: $N P(A) \leq N P(B) \Leftrightarrow P\left(A_{1}\right) \leq P\left(B_{1}\right), P\left(A_{2}\right) \leq P\left(B_{2}\right)$ and $\mathrm{P}\left(A_{3}\right) \geq P\left(B_{3}\right)$ or
2) Type2: $N P(A) \leq N P(B) \Leftrightarrow P\left(A_{1}\right) \leq P\left(B_{1}\right), P\left(A_{2}\right) \geq P\left(B_{2}\right)$ and $\mathrm{P}\left(A_{3}\right) \geq P\left(B_{3}\right)$.

## Definition 3.3

Let x be a non-empty set, and NCSs $A$ and $B$ in the form $A=\left\langle A_{1}, A_{2}, A_{3}\right\rangle, B=\left\langle B_{1}, B_{2}, B_{3}\right\rangle$ are NCSs. Then

1. $N P(A \cap B)$ may be defined two types as:
i) Type1: $N P(A \cap B)=\left\langle P\left(A_{1} \cap B_{1}\right), P\left(A_{2} \cap B_{2}\right), P\left(A_{3} \cup B_{3}\right)\right\rangle$ or
ii) Type2: $N P(A \cap B)=\left\langle P\left(A_{1} \cap B_{1}\right), P\left(A_{2} \cup B_{2}\right), P\left(A_{3} \cup B_{3}\right)\right\rangle$
2. $N P(A \cup B)$ may be defined two types as:
i) Type1: $N P(A \cup B)=\left\langle P\left(A_{1} \cup B_{1}\right), P\left(A_{2} \cap B_{2}\right), P\left(A_{3} \cap B_{3}\right)\right\rangle$ or
ii) Type 2: NP( $A \cup B)=\left\langle P\left(A_{1} \cup B_{1}\right), P\left(A_{2} \cup B_{2}\right), P\left(A_{3} \cap B_{3}\right)\right\rangle$
3. $N P\left(A^{c}\right)$ may be defined by three types
i) Type1: $N P\left(A^{c}\right)=\left\langle P\left(A_{1}^{c}\right), P\left(A_{2}^{c}\right), P\left(A_{3}^{c}\right)\right\rangle=<\left(1-A_{1}\right),\left(1-A_{2}\right),\left(1-A_{3}\right)>$ or
ii) Type2: $N P\left(A^{c}\right)=\left\langle P\left(A_{3}\right), P\left(A_{2}^{c}\right), P\left(A_{1}\right)\right\rangle$ or
iii) Type3: $N P\left(A^{c}\right)=\left\langle P\left(A_{3}\right), P\left(A_{2}\right), P\left(A_{1}\right)\right\rangle$.

## Proposition 3.1

Let $A$ and $B$ in the form $A=\left\langle A_{1}, A_{2}, A_{3}\right\rangle, B=\left\langle B_{1}, B_{2}, B_{3}\right\rangle$ are NCSs on a non-empty set x. Then

1) $\quad N P(A)^{c}+N P(A)=<\left(1,1,1>\right.$ or Type (iii) of $N P\left(X_{N}\right)=1_{N}$ or $=$ any types for $1_{N}$.
2) $\quad N P(A-B)=N P(A-B)=<\left(P\left(A_{1}\right)-P\left(A_{1} \cap B_{1}\right),\left(P\left(A_{2}\right)-P\left(A_{2} \cap B_{2}\right)\right.\right.$, $\left(P\left(A_{3}\right)-P\left(A_{3} \cap B_{3}\right)>\right.$
3) $N P(A / B)=<\frac{N P\left(A_{1}\right)}{N P\left(A_{1} \cap B_{1}\right)}, \frac{N P\left(A_{2}\right)}{N P\left(A_{2} \cap B_{2}\right)}, \frac{N P\left(A_{3}\right)}{N P\left(A_{3} \cap B_{3}\right)}>$

## Proposition 3.1

Let $A$ and $B$ in the form $A=\left\langle A_{1}, A_{2}, A_{3}\right\rangle, B=\left\langle B_{1}, B_{2}, B_{3}\right\rangle$ are NCSs on a non-empty set X. And $p, p_{N}$ are NCSs Then
i) $\quad N P(p)=\left\langle\frac{1}{n(X)}, \frac{1}{n(X)}, \frac{1}{n(X)}\right\rangle$
ii) $\quad N P\left(p_{N}\right)=\left\langle 0, \frac{1}{n(X)}, 1-\frac{1}{n(X)}\right\rangle$

## Example 3.1

1) Let $X=\{a, b, c, d\}$ and $A, B$ are two neutrosophic crisp events on $X$ defined by $A=\langle\{a\},\{b, c\},\{c, d\}\rangle, B=\langle\{a, b\},\{a, c\},\{c\}\rangle, p=\langle\{a\},\{c\},\{d\}\rangle$ then see that $N P(A)=\langle 0.25,0.5,0.5\rangle, N P(B)=\langle 0.5,0.5,0.25\rangle, N P(p)=\langle 0.25,0.25,0.25\rangle$, one can compute all probabilities from definitions.
2) If $A=\langle\{\phi\},\{b, c\},\{\phi\}\rangle$ and $B=\langle\{\phi\},\{d\},\{\phi\}\rangle$ are neutrosophic crisp sets on X then : $A \cap B=\langle\{\phi\},\{\phi\},\{\phi\}\rangle$ and $N P(A \cap B)=\langle 0,0,0\rangle=0_{N}$,
$A \cap B=\langle\{\phi\},\{b, c, d\},\{\phi\}\rangle$ and $N P(A \cap B)=\langle 0,0.75,0\rangle \neq 0_{N}$.

## Example 3.2

Let $X=\{a, b, c, d, e, f\}, A=\langle\{a, b, c, d\},\{e\},\{f\}\rangle, D=\langle\{a, b\},\{e, c\},\{f, d\}\rangle$ be a NCS-Type 2,
$B=\langle\{a, b, c\},\{d\},\{e\}\rangle$ be a NCT-Type I but not NCS-Type II, III, $C=\langle\{a, b\},\{c, d\},\{e, f, a\}\rangle$ be a NCS-Type III, but not NCS-Type IIII, $E=\langle\{a, b, c, d, e\},\{c, d\},\{e, f, a\}\rangle$,

$$
F=\langle\{a, b, c, d, e\}, \phi,\{e, f, a, d, c, b\}\rangle
$$

We can compute the probabilities for NCSs by the following:

$$
\begin{aligned}
& N P(A)=\left\langle\frac{4}{6}, \frac{1}{6}, \frac{1}{6}\right\rangle, N P(D)=\left\langle\frac{2}{6}, \frac{2}{6}, \frac{2}{6}\right\rangle, N P(B)=\left\langle\frac{3}{6}, \frac{1}{6}, \frac{1}{6}\right\rangle, N P(C)=\left\langle\frac{2}{6}, \frac{2}{6}, \frac{3}{6}\right\rangle, \\
& N P(E)=\left\langle\frac{4}{6}, \frac{2}{6}, \frac{3}{6}\right\rangle, N P(F)=\left\langle\frac{5}{6}, 0, \frac{6}{6}\right\rangle,
\end{aligned}
$$

## Remark 3.2

The probabilities of a neutrosophic crisp set are neutrosophic sets.

## Example 3.3

Let $X=\{a, b, c, d\}, A=\langle\{a, b\},\{c\},\{d\}\rangle, B=\langle\{a\},\{c\},\{d, b\}\rangle$ are NCS-Type I on X and $U_{1}=\langle\{a, b\},\{c, d\},\{a, d\}\rangle, U_{2}=\langle\{a, b, c\},\{c\},\{d\}\rangle$ are NCS-Type III on X, then we can find the following operations

1) Union, intersection, complement, deference and its probabilities
a)Type1: $A \cap B=\langle\{a\},\{c\},\{d, b\}\rangle, N P(A \cap B)=\langle 0.25,0.25,0.5\}\rangle$ and Type 2,3:
$A \cap B=\langle\{a\},\{c\},\{d, b\}\rangle, \quad N P(A \cap B)=\langle 0.25,0.25,0.5\}\rangle$.
2) $N P(A-B)$ may be equals

Type1: $N P(A-B)=<0.25,0,0>$, Type 2: $N P(A-B)=<0.25,0,0>$, Type 3:
$N P(A-B)=<0.25,0,0>$,
b) Type 2: $A \cup B=\langle\{a, b\},\{c\},\{d\}\rangle, N P(A \cup B)=\langle 0.5,0.25,0.25\}\rangle$ and Type 2: $A \cup B=\langle\{a . b\},\{c\},\{d\}\rangle$ $N P(A \cup B)=\langle 0.5,0.25,0.25\}\rangle$.
c) Type1: $A^{c}=\langle\{c, d\},\{a, b, d\},\{a, b, c\}\rangle$ NCS-Type III set on $\mathrm{X}, N P\left(A^{c}\right)=\langle 0.5,0.75,0.75\rangle$.

Type2: $A^{c}=\langle\{d\},\{a, b, d\},\{a, b\}\rangle$ NCS-Type III on X, NP $\left(A^{c}\right)=\langle 0.25,0.75,0.5\rangle$.
Type3: $A^{c}=\langle\{d\},\{c\},\{a, b\}\rangle$ NCS-Type III on X, $N P\left(A^{c}\right)=\langle 0.75,0.75,0.5\rangle$.
d) Type1: $B^{c}=\langle\{b, c, d\},\{a, b, d\},\{a, c\}\rangle$ be NCS-Type III on X,$N P\left(B^{c}\right)=\langle 0.75,0.75,0.5\rangle$

Type2: $B^{c}=\langle\{b, d\},\{c\},\{a\}\rangle$ NCS-Type I on X, and $N P\left(B^{c}\right)=\langle 0.5,0.25,0.25\rangle$.
Type3: $B^{c}=\langle\{b, d\},\{a, b, d\},\{a\}\rangle$ NCS-Type III on X and $N P\left(B^{c}\right)=\langle 0.5,0.75,0.25\rangle$.
e) Type 1: $U_{1} \cup U_{2}=\langle\{a, b, c\},\{c, d\},\{a, d\}\rangle$, NCS-Type III, $N P\left(U_{1} \cup U_{2}\right)=\langle\{0.75,0.5,0.5\rangle$,

Type2: $U_{1} \cup U_{2}=\langle\{a, b, c\},\{c\},\{a, d\}\rangle, N P\left(U_{1} \cup U_{2}\right)=\langle\{0.75,0.25,0.5\rangle$,
f) Type1: $U_{1} \cap U_{2}=\langle\{a, b\},\{c, d\},\{a, d\}\rangle$, NCS-Type III, $N P\left(U_{1} \cap U_{2}\right)=\langle 0.5,0.5,0.5\rangle$,

Type2: $U_{1} \cap U_{2}=\langle\{a, b\},\{c\},\{a, d\}\rangle$, NCS-Type III, and $N P\left(U_{1} \cap U_{2}\right)=\langle 0.5,0.25,0.5\rangle$,
g) Type 1: $U_{1}{ }^{c}=\langle\{c, d\},\{a, b\},\{c, b\}\rangle$, NCS-Type III and $N P\left(U_{1}{ }^{c}\right)=\langle 0.5,0.5,0.5\rangle$

Type 2: $U_{1}{ }^{c}=\langle\{a, d\},\{c, d\},\{a, b\}\rangle$, NCS-Type III and $N P\left(U_{1}{ }^{c}\right)=\langle 0.5,0.5,0.5\rangle$
Type3: $U_{1}{ }^{c}=\langle\{a, d\},\{a, b\},\{a, b\}\rangle$, NCS-Type III and $N P\left(U_{1}{ }^{c}\right)=\langle 0.5,0.5,0.5\rangle$.
h) Type1: $U_{2}{ }^{c}=\langle\{d\},\{a, b, d\},\{a, b, c\}\rangle$ NCS-Type III and $N P\left(U_{2}{ }^{c}\right)=\langle 0.25,0.75,0.75\rangle, \quad$ Type2:
$U^{c}{ }_{2}=\langle\{d\},\{c\},\{a, b, c\}\rangle$ NCS-Type III and $N P\left(U_{2}{ }^{c}\right)=\langle 0.25,0.25,0.75\rangle$, Type3:
$U^{c}{ }_{2}=\langle\{d\},\{a, b, d\},\{a, b, c\}\rangle$ NCS-Type III. $N P\left(U_{2}{ }^{c}\right)=\langle 0.25,0.75,0.75\rangle$.
2) Probabilities for events: $N P(A)=\langle 0.5,0.25,0.25\rangle, N P(B)=\langle 0.25,0.25,0.5\rangle, N P\left(U_{1}\right)=\langle 0.5,0.5,0.5\rangle$, $N P\left(U_{2}\right)=\langle 0.75,0.25,0.25\rangle$

$$
, N P\left(U_{1}{ }^{c}\right)=\langle 0.5,0.5,0.5\rangle, N P\left(U_{2}{ }^{c}\right)=\langle 0.25,0.75,0.75\rangle
$$

e) $(A \cap B)^{c}==\langle\{b, c, d\},\{a, b, d\},\{a, c\}\rangle$ be a NCS-Type III. $N P(A \cap B)^{c}=\langle 0.75,0.75,0.25\rangle$ be a neutrosophic set.
f) $N P(A)^{c} \cap N P(B)^{c}=\langle 0.5,0.75,0.75\rangle, N P(A)^{c} \cup N P(B)^{c}=\langle 0.75,0.75,0.5\rangle$
g) $N P(A \cup B)=N P(A)+N P(B)-N P(A \cap B)=\langle 0.5,0.25,0.25\}\rangle$
s) $N P(A)=\langle 0.5,0.25,0.25\rangle, N P(A)^{c}=\langle 0.5,0.75,0.75\rangle, N P(B)=\langle 0.25,0.25,0.5\rangle$,
$N P\left(B^{c}\right)=\langle 0.75,0.75,0.5\rangle$

## Probabilities for Products

## 1) The product of two events given by

$$
\begin{aligned}
& A \times B=\langle\{(a, a),(b, a)\},\{(c, c)\},\{(d, d),(d, b)\}\rangle, \text { and } N P(A \times B)=\langle 2 / 16,1 / 16,2 / 16\rangle \\
& B \times A=\langle\{(a, a),(a, b)\},\{(c, c)\},\{(d, d),(b, d)\}\rangle \text { and } N P(B \times A)=\langle 2 / 16,1 / 16,2 / 16\rangle \\
& A \times U_{1}=\langle\{(a, a),(b, a),(a, b),(b, b)\},\{(c, c),(c, d)\},\{(d, d),(d, a)\}\rangle, \text { and } N P\left(A \times U_{1}\right)=\langle 4 / 16,2 / 16,2 / 16\rangle \\
& U_{1} \times U_{2}=\langle\{(a, a),(b, a),(a, b),(b, b),(a, c),(b, c)\},\{(c, c),(d, c)\},\{(d, d),(a, d)\}\rangle \text { and } \\
& N P\left(U_{1} \times U_{2}\right)=\langle 6 / 16,2 / 16,2 / 16\rangle
\end{aligned}
$$

## Remark 3.3

The following diagram represents the relation between neutrosophic crisp concepts and neutrosphic sets

## Probability of Neutrosophic Crisp Sets
