#### Abstract

In this paper, some geometric properties of equiform Smarandache ruled surfaces in Minkowski space $E_{1}^{3}$ using an equiform frame are investigated. Also, we give the sufficient conditions that make these surfaces are equiform developable and equiform minimal related to the equiform curvatures and when the equiform base curve contained in a plane or general helix. Finally, we provide an example, such as these surfaces.

Keywords: Ruled surfaces; Equiform frame; Minkowski 3-space; Smarandache curve

## 1. Introduction

The theory of ruled surface is a branch of the classical differential geometry which has been developed by several researchers. In general, the rulings of the ruled surface are the set of a family of straight lines that depend on a parameter that is mentioned see Do Carmo (2016); Struik (1988); Barbosa and Colares (1986). One of the most interesting points is to study of ruled surfaces with different moving frames (see, for example, Hu et. al. (2020); Ibrahim Al-Dayel and Solouma
(2021); Lam (2020); Ouarab et al. (2018); Ouarab et al. (2020); Ouarab (2021); Solouma and Ibrahim AL-Dayel (2021); Emad Solouma and Mohamed Abdelkawy (2022)).

In Euclidean and Lorentzian geometry, the Smarandache curve is the curve whose position vector is made by Frenet frame vectors on another regular curve (Ashbacher (1997); Bishop (1975); Iseri (2002); Mao (2006)). Many researchers (such as Cetin et al. (2014); Emad Solouma (2021); Solouma (2017); Solouma and Mahmoud (2017); Solouma and Mahmoud (2019); Solouma (2021); Turgut and Yılmaz (2008); Taskopru and Tosun (2014); Yılmaz and Turgut (2010)) studied Smarandache curves in Minkowski and the Euclidean spaces.

In this work, we introduce the definitions of a special kind of ruled surfaces called equiform Smarandache ruled surfaces via the equiform frame in Minkowski 3- space. The main results are presented in theorems that we concert the sufficient and necessary conditions for those ruled surfaces to be equiform developable and equiform minimally. Finally, an illustration-based example is provided.

## 2. Preliminaries

In Minkowski space $\mathrm{E}_{1}^{3}$ the Lorentzian product is defined as:

$$
\mathcal{H}=-d e_{1}^{2}+d e_{2}^{2}+d e_{3}^{2}
$$

where $\left(e_{1}, e_{2}, e_{3}\right)$ is the $\mathrm{E}_{1}^{3}$ rectilinear coordinate system. An arbitrary $u \in \mathrm{E}_{1}^{3}$ vector is one of the following; spacelike if $\mathcal{H}(u, u)>0$ or $u=0$, timelike if $\mathcal{H}(u, u)<0$ and zero if $\mathcal{H}(u, u)=$ 0 and $u \neq 0$. Likewise, a curve $\xi=\xi(\varrho)$ can be spacelike, timelike or zero if its $\xi^{\prime}(\varrho)$ is spacelike, timelike or null. Let $\varphi=\varphi(\varrho)$ is a spacelike curve with a timelike principal normal. If $\{t, n, b\}$ denotes the moving Frenet frame of the spacelike curve $\varphi$, then $\{t, n, b\}$ has the following properties:

$$
\begin{align*}
\dot{t}(\varrho) & =\kappa(\varrho) n(\varrho) \\
\dot{n}(\varrho) & =\kappa(\varrho) t(\varrho)+\tau(\varrho) b(\varrho)  \tag{1}\\
\dot{b}(\varrho) & =\tau(\varrho) n(\varrho)
\end{align*}
$$

where $\left(\cdot \frac{d}{d \varrho}\right), \mathcal{H}(t, t)=-\mathcal{H}(n, n)=\mathcal{H}(b, b)=1$ and $\mathcal{H}(t, n)=\mathcal{H}(t, b)=\mathcal{H}(n, b)=0$.
For a spacelike curve $\zeta: I \rightarrow \mathrm{E}_{1}^{3}$ with a timelike principal normal in $\mathrm{E}_{1}^{3}$. The equiform parameter of $\zeta$ by $\vartheta=\int \kappa d \varrho$. Then $\sigma=\frac{d \varrho}{d \vartheta}$, where $\sigma=\frac{1}{\kappa}$. We recall that $\{T, N, B\}$ is the moving equiform Frenet frame with the equiform tangent $T(\vartheta)=\sigma t(\varrho)$, the equiform principal normal $N(\vartheta)=$ $\sigma n(\varrho)$ and the equiform binormal $B(\vartheta)=\sigma b(\varrho)$. The equiform curvatures of $\zeta=\zeta(\vartheta)$ are defined by $k_{1}(\vartheta)=\dot{\sigma}=\frac{d \sigma}{d \varrho}$ and $k_{2}(\vartheta)=\left(\frac{\tau}{\kappa}\right)$. As a result, the $\zeta$ equiform Frenet frame is given as:

$$
\begin{align*}
T^{\prime}(\vartheta) & =k_{1}(\vartheta) T(\vartheta)+N(\vartheta), \\
N^{\prime}(\vartheta) & =-T(\vartheta)+k_{1}(\vartheta) N(\vartheta)+k_{2}(\vartheta) B(\vartheta),  \tag{2}\\
B^{\prime}(\vartheta) & =k_{1}(\vartheta) N(\vartheta)+k_{2}(\vartheta) B(\vartheta),
\end{align*}
$$

for $\left({ }^{\prime}=\frac{d}{d \vartheta}\right), \mathcal{H}(T, T)=-\mathcal{H}(B, B)=\mathcal{H}(N, N)=\sigma^{2}$, and $\mathcal{H}(T, B)=\mathcal{H}(N, B)=\mathcal{H}(T, N)=$ 0.

Let $\zeta=\zeta(\vartheta)$ be a regular equiform spacelike curve in $\mathrm{E}_{1}^{3}$ via equiform frame $\{T, N, B\}$. Then $T N, T B$ and $N B$ - equiform Smarandache curves of $\zeta$ are defined, respectively, as follows (Solouma (2021)):

$$
\begin{aligned}
& \varphi\left(\vartheta^{*}(\vartheta)\right)=\frac{1}{\sqrt{2} \sigma}(T(\vartheta)+N(\vartheta)), \\
& \psi\left(\vartheta^{*}(\vartheta)\right)=\frac{1}{\sqrt{2} \sigma}(T(\vartheta)+B(\vartheta)), \\
& \omega\left(\vartheta^{*}(\vartheta)\right)=\frac{1}{\sqrt{2} \sigma}(N(\vartheta)+B(\vartheta)) .
\end{aligned}
$$

The Lorentzian sphere with the origin center in the $E_{1}^{3}$ space and a radius of $\epsilon>0$ is defined as

$$
S_{1}^{2}=\left\{x \in \mathrm{E}_{1}^{3}: \mathcal{H}(x, x)=\epsilon^{2}\right\} .
$$

A ruled surface $\Gamma$ in $E_{1}^{3}$ can be represented as

$$
\begin{equation*}
\Gamma(\varrho, v)=\varphi(\varrho)+v X(\varrho) \tag{3}
\end{equation*}
$$

where $\varphi(\varrho)$ is the base curve and $X(\varrho)$ is a space curve that represents the direction of a straight line.

The unit normal vector field $\mathbb{N}$ on $\Gamma$ can be defined by

$$
\begin{equation*}
\mathbb{N}=\frac{\Gamma_{Q} \times \Gamma_{v}}{\left\|\Gamma_{\varrho} \times \Gamma_{v}\right\|} \tag{4}
\end{equation*}
$$

where $\Gamma_{\varrho}=\frac{\partial \Gamma}{\partial \varrho}$ and $\Gamma_{v}=\frac{\partial \Gamma}{\partial v}$. The components of $\Gamma$ 's first and second fundamental forms are given by, and respectively,

$$
\begin{aligned}
& E=\left\|\Gamma_{\varrho}\right\|^{2}, \quad F=\left\langle\Gamma_{\varrho}, \Gamma_{v}\right\rangle, \quad G=\left\|\Gamma_{v}\right\|^{2}, \\
& e=\left\langle\Gamma_{\varrho \varrho}, \mathbb{N}\right\rangle, \quad f=\left\langle\Gamma_{\varrho v}, \mathbb{N}\right\rangle, \quad g=\left\langle\Gamma_{v v}, \mathbb{N}\right\rangle .
\end{aligned}
$$

The Gaussian and mean curvatures of $\Gamma$ respectively are given by

$$
\begin{gather*}
\mathrm{K}=\frac{e g-f^{2}}{E G-F^{2}},  \tag{5}\\
\mathrm{H}=\frac{E g+G e-2 F f}{2\left(E G-F^{2}\right)} . \tag{6}
\end{gather*}
$$

A ruled surface is developable if and only if $\mathrm{K}=0$ and minimal if and only if $\mathrm{H}=0$.

## 3. Main results

In this section, we define the equiform Smarandache ruled surfaces within Mikowski 3-space $\mathrm{E}_{1}^{3}$ referring to the equiform frame $\{T, N, B\}$. Also, we investigate the necessary and sufficient conditions that make these surfaces have $\mathrm{K}=0$ and $\mathrm{H}=0$.

### 3.1 TN-equiform Smarandache ruled surface

## Definition 3.1.

For a regular equiform spacelike curve $\zeta=\zeta(\vartheta)$ in $\mathrm{E}_{1}^{3}$ via the frame (2). The $T N$-equiform Smarandache ruled surface is given by

$$
\begin{equation*}
\Lambda=\Lambda(\vartheta, v)=\frac{1}{\sqrt{2} \sigma}(T(\vartheta)+N(\vartheta))+v B(\vartheta) \tag{7}
\end{equation*}
$$

## Theorem 3.1.

Let $\Lambda=\Lambda(\vartheta, v)$ is $T N$-equiform Smarandache ruled surface in $\mathrm{E}_{1}^{3}$ defined by (7). Then, we have 1. If $k_{1}=1$, then $\Lambda$ is equiform developable surface and $\mathrm{H}_{\Lambda}$ given by the formula

$$
\mathrm{H}_{\Lambda}=\frac{\sigma v k_{2}\left(\sqrt{2} \sigma v k_{2}+2\right)+2 k_{2}\left(k_{2}+\sqrt{2} \sigma v\right)}{\sqrt{2}\left(\sqrt{2} \sigma v k_{2}+2\right)^{\frac{3}{2}}} .
$$

2. If $\zeta(\varrho)$ is a plane curve $\left(k_{2}=0\right)$, then $\Lambda$ is equiform developable surface and $H_{\Lambda}$ satisfying

$$
\mathrm{H}_{\Lambda}=\frac{\left(k_{1}+1\right)\left[k_{1}^{\prime}+k_{1}\left(k_{1}-2\right)\right]+\left(k_{1}-1\right)\left(k_{1}^{2}+k_{1}^{\prime}+2 k_{1}+1\right)}{4 \sqrt{2}\left(k_{1}\right)^{\frac{3}{2}}}
$$

## Proof:

Let $\Lambda(\vartheta, v)=\frac{1}{\sqrt{2} \sigma}(T(\vartheta)+N(\vartheta))+v B(\vartheta)$ be $T N$-equiform Smarandache ruled surface recording by the equiform frame $\{T, N, B\}$ in $\mathrm{E}_{1}^{3}$. Taking the first derivative of $\Lambda(\vartheta, v)$ with respect to $\vartheta$ and $v$, we get

$$
\begin{align*}
& \Lambda_{\vartheta}=\left[\frac{k_{1}-1}{\sqrt{2} \sigma}\right] T(\vartheta)+\left[\frac{k_{1}+1}{\sqrt{2} \sigma}+v k_{2}\right] N(\vartheta)+\left[\frac{k_{2}}{\sqrt{2} \sigma}+v k_{1}\right] B(\vartheta),  \tag{8}\\
& \Lambda_{v}=B(\vartheta)
\end{align*}
$$

From (8), The components of $\Lambda$ 's first fundamental form and the unit normal vector field are given by:

$$
\begin{align*}
& E_{\Lambda}=\frac{1}{2}\left[\left(k_{1}-1\right)^{2}-\left(k_{1}+\sqrt{2} \sigma v k_{2}\right)^{2}+\left(k_{2}+\sqrt{2} \sigma v k_{1}\right)^{2}\right] \\
& F_{\Lambda}=\frac{\sigma}{\sqrt{2}}\left[k_{2}+\sqrt{2} \sigma v k_{1}\right]  \tag{9}\\
& G_{\Lambda}=\sigma^{2}
\end{align*}
$$

$$
\begin{equation*}
\mathbb{N}_{\Lambda}=\frac{\left(k_{1}+\sqrt{2} \sigma v k_{2}+1\right) T(\vartheta)-\left(k_{1}-1\right) N(\vartheta)}{\sigma \sqrt{\left(k_{1}+\sqrt{2} \sigma v k_{2}+1\right)^{2}-\left(k_{1}-1\right)^{2}}} \tag{10}
\end{equation*}
$$

Another time, we can differentiate (7) with respect to $\vartheta$ and $v$, respectively, and use (2) to get

$$
\begin{align*}
& \Lambda_{\vartheta \vartheta}=\varepsilon_{1} T(\vartheta)+\varepsilon_{2} N(\vartheta)+\varepsilon_{3} B(\vartheta), \\
& \Lambda_{\vartheta v}=k_{2} N(\vartheta)+k_{1} B(\vartheta),  \tag{11}\\
& \Lambda_{v v}=0 .
\end{align*}
$$

where

$$
\begin{align*}
& \varepsilon_{1}=\frac{1}{\sqrt{2} \sigma}\left[k_{1}^{\prime}+k_{1}\left(k_{1}-2\right)+\sqrt{2} \sigma v k_{2}+1\right], \\
& \varepsilon_{2}=\frac{1}{\sqrt{2} \sigma}\left[k_{1}^{2}+k_{2}^{2}+k_{1}^{\prime}+2 k_{1}+\sqrt{2} \sigma v\left(k_{1} k_{2}+k_{2}^{\prime}\right)\right],  \tag{12}\\
& \varepsilon_{3}=\frac{1}{\sqrt{2} \sigma}\left[k_{2}^{\prime}+k_{2}\left(2 k_{1}+1\right)+\sqrt{2} \sigma v\left(k_{1}^{2}+k_{2}^{2}+k_{2}^{\prime}\right)\right] .
\end{align*}
$$

From (10) and (11), the components of $\Lambda$ 's second fundamental form are given by:

$$
\begin{align*}
& e_{\Lambda}=\frac{\sigma\left\{\varepsilon_{1}\left[k_{1}+\sqrt{2} \sigma v k_{2}+1\right]+\varepsilon_{2}\left(k_{1}-1\right)\right\}}{\sqrt{\left(k_{1}+\sqrt{2} \sigma v k_{2}+1\right)^{2}-\left(k_{1}-1\right)^{2}}}, \\
& f_{\Lambda}=\frac{\sigma k_{2}\left(k_{1}-1\right)}{\sqrt{\left(k_{1}+\sqrt{2} \sigma v k_{2}+1\right)^{2}-\left(k_{1}-1\right)^{2}}},  \tag{13}\\
& g_{\Lambda}=0 .
\end{align*}
$$

So, from (9) and (11), the equiform Gaussian and mean curvatures of $T N$-equiform Smarandache ruled surface $\Lambda$ given by:

$$
\begin{align*}
& \mathrm{K}_{\Lambda}=\frac{k_{2}^{2}\left(k_{1}-1\right)^{2}}{\left[\left(k_{1}+\sqrt{2} \sigma v k_{2}+1\right)^{2}-\left(k_{1}-1\right)^{2}\right]^{2}}, \\
& \mathrm{H}_{\Lambda}=\frac{2 \sqrt{2} k_{2}\left(k_{2}+\sqrt{2} \sigma v k_{2}\right)-2 \sigma\left\{\varepsilon_{1}\left[k_{1}+\sqrt{2} \sigma v k_{2}+1\right]+\varepsilon_{2}\left(k_{1}-1\right)\right\}}{\left[\left(k_{1}+\sqrt{2} \sigma v k_{2}+1\right)^{2}-\left(k_{1}-1\right)^{2}\right]^{\frac{3}{2}}} . \tag{14}
\end{align*}
$$

Consequently, from (14) we complete our proof.

## Corollary 3.2.

Let $\Lambda=\Lambda(\vartheta, v)$ is $T N$-equiform Smarandache ruled surface in $\mathrm{E}_{1}^{3}$ defined by (7). Then $\Lambda$ is equiform minimal surface if and only if the equiform curvatures satisfy the following differential equation

$$
2 \sqrt{2} k_{2}\left(k_{2}+\sqrt{2} \sigma v k_{2}\right)-2 \sigma\left\{\varepsilon_{1}\left[k_{1}+\sqrt{2} \sigma v k_{2}+1\right]+\varepsilon_{2}\left(k_{1}-1\right)\right\}=0,
$$

where $\varepsilon_{1}$ and $\varepsilon_{2}$ are given by (12).

## Proof:

Let $\Lambda(\vartheta, v)$ be $T N$-equiform Smarandache ruled surface defined by (7) via the equiform frame $\{T, N, B\}$ in $\mathrm{E}_{1}^{3}$. From (14), the equiform surface $\Lambda(\vartheta, v)$ is equiform minimal surface if and only if $\mathrm{H}_{\Lambda}=0$ which mean that

$$
2 \sqrt{2} k_{2}\left(k_{2}+\sqrt{2} \sigma v k_{2}\right)-2 \sigma\left\{\varepsilon_{1}\left[k_{1}+\sqrt{2} \sigma v k_{2}+1\right]+\varepsilon_{2}\left(k_{1}-1\right)\right\}=0
$$

where $\varepsilon_{1}$ and $\varepsilon_{2}$ are given by (12) which complete our proof.

### 3.2 TB-equiform Smarandache ruled surface

## Definition 3.2.

For a regular equiform spacelike curve $\zeta=\zeta(\vartheta)$ in $\mathrm{E}_{1}^{3}$ via the frame (2). The $T B$-equiform Smarandache ruled surface is given by

$$
\begin{equation*}
\Theta=\Theta(\vartheta, v)=\frac{1}{\sqrt{2} \sigma}(T(\vartheta)+B(\vartheta))+v N(\vartheta) \tag{15}
\end{equation*}
$$

## Theorem 3.3.

Let $\Theta=\Theta(\vartheta, v)$ is $T B$-equiform Smarandache ruled surface in $\mathrm{E}_{1}^{3}$ defined by (15). Then, we have 1. If $\zeta(\varrho)$ has non-zero constant curvature $\left(k_{1}=0\right)$, then $\Theta$ is equiform developable surface and

$$
\mathrm{H}_{\Theta}=\frac{-\sqrt{2} k_{2}\left(k_{2}+1\right)+\sigma v k_{2}^{\prime}}{2 \sigma^{2} v^{2}\left(k_{2}+1\right)^{\frac{3}{2}}}
$$

2. If $\zeta(\varrho)$ is a general helix $\left(k_{2}=1\right)$, then $\Theta$ is equiform developable surface and

$$
\mathrm{H}_{\Theta}=-\frac{k_{1}^{\prime}+k_{1}\left(k_{1}+\sqrt{2} \sigma v\right)}{\left(k_{1}-\sqrt{2} \sigma v\right)^{2}} .
$$

## Proof:

We can study the $\mathrm{K}_{\Theta}$ and $\mathrm{H}_{\Theta}$ of $T B$-equiform Smarandache ruled surface via the equiform frame $\{T, N, B\}$. The velocity vectors of (15) are given by

$$
\begin{align*}
& \Theta_{\vartheta}=\left[\frac{k_{1}-\sqrt{2} \sigma v}{\sqrt{2} \sigma}\right] T(\vartheta)+\left[\frac{k_{2}+\sqrt{2} \sigma v k_{1}+1}{\sqrt{2} \sigma}\right] N(\vartheta)+\left[\frac{k_{1}+\sqrt{2} \sigma v k_{2}}{\sqrt{2} \sigma}\right] B(\vartheta)  \tag{16}\\
& \Theta_{v}=N(\vartheta)
\end{align*}
$$

Now, using (16), we get the quantities of the first fundamental form and the unit normal vector field of $\Theta$ are given by:

$$
\begin{align*}
E_{\Theta} & =\frac{1}{2}\left[\left(k_{1}-\sqrt{2} \sigma v\right)^{2}-\left(k_{2}+\sqrt{2} \sigma v k_{1}+1\right)^{2}+\left(k_{1}+\sqrt{2} \sigma v k_{2}\right)^{2}\right] \\
F_{\Theta} & =-\frac{\sigma}{\sqrt{2}}\left[k_{2}+\sqrt{2} \sigma v k_{1}+1\right]  \tag{17}\\
G_{\Theta} & =-\sigma^{2}
\end{align*}
$$

$$
\begin{equation*}
\mathbb{N}_{\Theta}=\frac{\left(k_{1}+\sqrt{2} \sigma v k_{2}\right) T(\vartheta)+\left(k_{1}-\sqrt{2} \sigma v\right) B(\vartheta)}{\sigma \sqrt{\left(k_{1}+\sqrt{2} \sigma v k_{2}\right)^{2}+\left(k_{1}-\sqrt{2} \sigma v\right)^{2}}} \tag{18}
\end{equation*}
$$

Differentiating (16) with respect to $\vartheta$ and $v$ respectively and using (2) we get

$$
\begin{align*}
& \Theta_{\vartheta \vartheta}=\mu_{1} T(\vartheta)+\mu_{2} N(\vartheta)+\mu_{3} B(\vartheta), \\
& \Theta_{\vartheta v}=-T(\vartheta)+k_{1} N(\vartheta)+k_{2} B(\vartheta),  \tag{19}\\
& \Theta_{v v}=0,
\end{align*}
$$

where

$$
\begin{align*}
& \mu_{1}=\frac{1}{\sqrt{2} \sigma}\left[k_{1}^{\prime}-k_{2}+k_{1}\left(k_{1}-\sqrt{2} \sigma v\right)-\sqrt{2} \sigma v k_{1}+1\right], \\
& \mu_{2}=\frac{1}{\sqrt{2} \sigma}\left[k_{1}^{\prime}+k_{2}^{\prime}+k_{1}\left(k_{2}+\sqrt{2} \sigma v k_{1}+2\right)+k_{2}\left(k_{1}+\sqrt{2} \sigma v k_{2}\right)+\sqrt{2} \sigma v\left(k_{1}^{\prime}-1\right)\right],  \tag{20}\\
& \mu_{3}=\frac{1}{\sqrt{2} \sigma}\left[k_{1}^{\prime}+k_{2}\left(k_{2}+\sqrt{2} \sigma v k_{1}+1\right)+k_{1}\left(k_{1}+\sqrt{2} \sigma v k_{2}\right)+\sqrt{2} \sigma v k_{2}^{\prime}\right] .
\end{align*}
$$

From (18) and (19), the quantities of the second fundamental form of $\Theta$ are given by:

$$
\begin{align*}
e_{\Theta} & =\frac{\sigma\left\{\mu_{1}\left(k_{1}+\sqrt{2} \sigma v k_{2}\right)+\mu_{2}\left(k_{1}+\sqrt{2} \sigma v\right)\right\}}{\sqrt{\left(k_{1}+\sqrt{2} \sigma v k_{2}\right)^{2}+\left(k_{1}-\sqrt{2} \sigma v\right)^{2}}}, \\
f_{\Theta} & =\frac{\sigma k_{1}\left(k_{2}-1\right)}{\sqrt{\left(k_{1}+\sqrt{2} \sigma v k_{2}\right)^{2}+\left(k_{1}-\sqrt{2} \sigma v\right)^{2}}},  \tag{21}\\
g_{\Theta} & =0 .
\end{align*}
$$

Then, from (17) and (21), the equiform $\mathrm{K}_{\Theta}$ and $\mathrm{H}_{\Theta}$ of $T B$-equiform Smarandache ruled surface $\Theta$ given by

$$
\begin{align*}
& \mathrm{K}_{\Theta}=\frac{2 k_{1}^{2}\left(k_{2}-1\right)^{2}}{\left[\left(k_{1}+\sqrt{2} \sigma v k_{2}\right)^{2}+\left(k_{1}-\sqrt{2} \sigma v\right)^{2}\right]^{2}}, \\
& \mathrm{H}_{\Theta}=\frac{2 \sqrt{2} k_{1}\left(k_{1}-1\right)\left(k_{2}+\sqrt{2} \sigma v k_{1}+1\right)-2 \sigma\left\{\mu_{1}\left[k_{1}+\sqrt{2} \sigma v k_{2}\right]+\mu_{3}\left(k_{1}+\sqrt{2} \sigma v\right)\right\}}{\left[\left(k_{1}+\sqrt{2} \sigma v k_{2}\right)^{2}+\left(k_{1}-\sqrt{2} \sigma v\right)^{2}\right]^{\frac{3}{2}}}, \tag{22}
\end{align*}
$$

which complete our proof.

## Corollary 3.4.

Let $\Theta=\Theta(\vartheta, v)$ is $T B$-equiform Smarandache ruled surface in $\mathrm{E}_{1}^{3}$ defined by (15). Then $\Theta$ is equiform minimal surface if and only if the equiform curvatures satisfy the following differential equation

$$
2 \sqrt{2} k_{1}\left(k_{1}-1\right)\left(k_{2}+\sqrt{2} \sigma v k_{1}+1\right)-2 \sigma\left\{\mu_{1}\left[k_{1}+\sqrt{2} \sigma v k_{2}\right]+\mu_{3}\left(k_{1}+\sqrt{2} \sigma v\right)\right\}=0
$$

where $\mu_{1}$ and $\mu_{3}$ are given by (20).

## Proof:

Let $\Theta=\Theta(\vartheta, v)$ be $T B$-equiform Smarandache ruled surface defined by (15) in $\mathrm{E}_{1}^{3}$ via the equiform frame $\{T, N, B\}$. Then, $H_{\Theta}=0$ implies that $\Theta(\vartheta, v)$ is equiform minimal surface. From (22), we have

$$
2 \sqrt{2} k_{1}\left(k_{1}-1\right)\left(k_{2}+\sqrt{2} \sigma v k_{1}+1\right)-2 \sigma\left\{\mu_{1}\left[k_{1}+\sqrt{2} \sigma v k_{2}\right]+\mu_{3}\left(k_{1}+\sqrt{2} \sigma v\right)\right\}=0,
$$

for $\mu_{1}$ and $\mu_{3}$ are given by (20). This complete the proof.

## 3.3 $N B$-equiform Smarandache ruled surface

## Definition 3.2.

For a regular equiform spacelike curve $\zeta=\zeta(\vartheta)$ in $\mathrm{E}_{1}^{3}$ via the frame (2). The $N B$-equiform Smarandache ruled surface is given by

$$
\begin{equation*}
\Upsilon=\Upsilon(\vartheta, v)=\frac{1}{\sqrt{2} \sigma}(N(\vartheta)+B(\vartheta))+v T(\vartheta) \tag{23}
\end{equation*}
$$

## Theorem 3.5.

Let $\Upsilon=\Upsilon(\vartheta, v)$ is $N B$-equiform Smarandache ruled surface in $\mathrm{E}_{1}^{3}$ defined by (23). If $k_{1}+k_{2}=$ 0 , then $\Upsilon$ is equiform developable surface satisfying

$$
\mathrm{H}_{\Upsilon}=\frac{k_{2}}{2 \sigma^{2} v^{2}}
$$

## Proof:

We compute the equiform Gaussian and the equiform mean curvatures of $N B$-equiform Smarandache ruled surface given by (23) via the equiform frame $\{T, N, B\}$. The $Y$ 's velocity vectors are given by

$$
\begin{align*}
& \Upsilon_{\vartheta}=\left[\frac{\sqrt{2} \sigma v k_{1}-1}{\sqrt{2} \sigma}\right] T(\vartheta)+\left[\frac{k_{1}+k_{2}+\sqrt{2} \sigma v}{\sqrt{2} \sigma}\right] N(\vartheta)+\left[\frac{k_{1}+k_{2}}{\sqrt{2} \sigma}\right] B(\vartheta),  \tag{24}\\
& \Upsilon_{v}=T(\vartheta) .
\end{align*}
$$

By using (24), we get the components of the first fundamental form and the unit normal vector field of $\Upsilon$ are given by:

$$
\begin{align*}
& E_{Y}=\frac{1}{2}\left[\left(\sqrt{2} \sigma v k_{1}-1\right)^{2}-\left(k_{1}+k_{2}+\sqrt{2} \sigma v\right)^{2}+\left(k_{1}+k_{2}\right)^{2}\right], \\
& F_{Y}=\frac{\sigma}{\sqrt{2}}\left[\sqrt{2} \sigma v k_{1}-1\right],  \tag{25}\\
& G_{Y}=\sigma^{2}, \\
& \quad \mathbb{N}_{\Upsilon}=\frac{\left(k_{1}+k_{2}\right) N(\vartheta)-\left(k_{1}+k_{2}+\sqrt{2} \sigma v\right) B(\vartheta)}{\sqrt{2} \sigma \sqrt{\sigma v\left(k_{1}+k_{2}+\sigma v\right)}} . \tag{26}
\end{align*}
$$

Using (2) and differentiating (24) again with respect to $\vartheta$ and $v$ respectively, we get

$$
\begin{align*}
& \Upsilon_{\vartheta \vartheta}=\alpha_{1} T(\vartheta)+\alpha_{2} N(\vartheta)+\alpha_{3} B(\vartheta) \\
& \Upsilon_{\vartheta v}=k_{1} T(\vartheta)+N(\vartheta)  \tag{27}\\
& \Upsilon_{v v}=0
\end{align*}
$$

where

$$
\begin{align*}
& \alpha_{1}=\frac{1}{\sqrt{2} \sigma}\left[k_{1}\left(\sqrt{2} \sigma v k_{1}-1\right)+\sqrt{2} \sigma v\left(k_{1}^{\prime}-1\right)-k_{1}-k_{2}\right] \\
& \alpha_{2}=\frac{1}{\sqrt{2} \sigma}\left[k_{1}^{\prime}+k_{2}^{\prime}+k_{1}\left(k_{1}+k_{2}+\sqrt{2} \sigma v\right)+k_{2}\left(k_{1}+k_{2}\right)+\sqrt{2} \sigma v k_{1}-1\right]  \tag{28}\\
& \alpha_{3}=\frac{1}{\sqrt{2} \sigma}\left[k_{1}^{\prime}+k_{2}^{\prime}+k_{1}\left(k_{1}+k_{2}+\sqrt{2} \sigma v\right)+k_{2}\left(k_{1}+k_{2}\right)\right]
\end{align*}
$$

From (26) and (27), the quantities of the second fundamental form of $\Upsilon$ are given by:

$$
\begin{align*}
& e_{\Upsilon}=-\frac{\sigma\left\{\alpha_{2}\left(k_{1}+k_{2}\right)+\alpha_{3}\left(k_{1}+k_{2}+\sqrt{2} \sigma v\right)\right\}}{\sqrt{2} \sqrt{\sigma v\left(k_{1}+k_{2}+\sigma v\right)}} \\
& f_{\Upsilon}=-\frac{\sigma\left(k_{1}+k_{2}\right)}{\sqrt{2} \sigma \sqrt{\sigma v\left(k_{1}+k_{2}+\sigma v\right)}}  \tag{29}\\
& g_{\Upsilon}=0
\end{align*}
$$

Then, from (25) and (29), the equiform Gaussian curvature $\mathrm{K}_{\Upsilon}$ and the equiform mean curvature $\mathrm{H}_{\Upsilon}$ of $\Upsilon$ are given by

$$
\begin{align*}
& \mathrm{K}_{\Upsilon}=\frac{\left(k_{1}+k_{2}\right)^{2}}{2 \sigma^{2} v^{2}\left(k_{1}+k_{2}+\sigma v\right)^{2}} \\
& \mathrm{H}_{\Upsilon}=\frac{\sqrt{2} \sigma\left\{\alpha_{2}\left(k_{1}+k_{2}\right)+\alpha_{3}\left(k_{1}+k_{2}+\sqrt{2} \sigma v\right)\right\}+2\left(k_{1}+k_{2}\right)\left(\sqrt{2} \sigma v k_{1}-1\right)}{2\left[\sigma v\left(k_{1}+k_{2}+\sigma v\right)\right]^{\frac{3}{2}}} . \tag{30}
\end{align*}
$$

As a consequence of the above results, we complete the proof.

## Corollary 3.4.

Let $\Upsilon=\Upsilon(\vartheta, v)$ is $N B$-equiform Smarandache ruled surface in $\mathrm{E}_{1}^{3}$ defined by (23). Then $\Upsilon$ is equiform minimal surface if and only if the equiform curvatures satisfy the following differential equation

$$
\sigma\left\{\alpha_{2}\left(k_{1}+k_{2}\right)+\alpha_{3}\left(k_{1}+k_{2}+\sqrt{2} \sigma v\right)\right\}+\sqrt{2}\left(k_{1}+k_{2}\right)\left(\sqrt{2} \sigma v k_{1}-1\right)=0
$$

where $\alpha_{2}$ and $\alpha_{3}$ are given by (28).

## Proof:

Let $\Upsilon=\Upsilon(\vartheta, v)$ be $N B$-equiform Smarandache ruled surface defined by (23) in $\mathrm{E}_{1}^{3}$ via the equiform frame $\{T, N, B\}$. As the above way, the equiform mean curvature $\mathrm{H}_{\Upsilon}$ of $\Upsilon$ is given by (30). Then, $H_{\Upsilon}=0$ means the equiform surface $\Upsilon(\vartheta, v)$ is equiform minimal surface. Then, from (30), we have

$$
\sigma\left\{\alpha_{2}\left(k_{1}+k_{2}\right)+\alpha_{3}\left(k_{1}+k_{2}+\sqrt{2} \sigma v\right)\right\}+\sqrt{2}\left(k_{1}+k_{2}\right)\left(\sqrt{2} \sigma v k_{1}-1\right)=0
$$

where $\alpha_{2}$ and $\alpha_{3}$ are given by (28) which complete the proof.

### 3.4 Example

Consider the case of a regular spacelike curve $\varphi(\varrho)$ with a timelike principal normal in $\mathrm{E}_{1}^{3}$ (see Figure 1)

$$
\begin{equation*}
\varphi(\varrho)=\left(\frac{\varrho}{\sqrt{2}} \cosh (\sqrt{2} \ln \varrho), \frac{\varrho}{\sqrt{2}} \sinh (\sqrt{2} \ln \varrho), \frac{\varrho}{\sqrt{2}}\right) \tag{31}
\end{equation*}
$$

Then, the Frenet apparatus are given as the following

Figure 1: Spacelike curve $\varphi=\varphi(\varrho)$

$$
\begin{gathered}
t(\varrho)=\left(\frac{1}{\sqrt{2}} \cosh (\sqrt{2} \ln \varrho)+\sinh (\sqrt{2} \ln \varrho), \frac{1}{\sqrt{2}} \sinh (\sqrt{2} \ln \varrho)+\cosh (\sqrt{2} \ln \varrho), \frac{1}{\sqrt{2}}\right) \\
n(\varrho)=(\sqrt{2} \cosh (\sqrt{2} \ln \varrho)+\sinh (\sqrt{2} \ln \varrho), \sqrt{2} \sinh (\sqrt{2} \ln \varrho)+\cosh (\sqrt{2} \ln \varrho), 0) \\
\kappa=\frac{1}{\varrho}, \quad \sigma=\varrho, \quad k_{1}=1 \\
b(\varrho)=\left(\frac{1}{\sqrt{2}} \cosh (\sqrt{2} \ln \varrho)+\sinh (\sqrt{2} \ln \varrho), \frac{1}{\sqrt{2}} \sinh (\sqrt{2} \ln \varrho)+\cosh (\sqrt{2} \ln \varrho), \frac{-1}{\sqrt{2}}\right), \\
\tau=\frac{1}{\varrho}, \quad k_{2}=1 .
\end{gathered}
$$

Then, the equiform parameter is $\vartheta=\int_{0}^{\varrho} \kappa d \varrho=\ln \varrho$, so we have $\varrho=\sigma=e^{\vartheta}$. Now, the equiform spacelike curve $\zeta(\vartheta)$ is define as (see Figure 2)

$$
\begin{equation*}
\zeta(\vartheta)=\left(\frac{e^{\vartheta}}{\sqrt{2}} \cosh (\sqrt{2} \vartheta), \frac{e^{\vartheta}}{\sqrt{2}} \sinh (\sqrt{2} \vartheta), \frac{e^{\vartheta}}{\sqrt{2}}\right) . \tag{32}
\end{equation*}
$$

Figure 2: Equiform spacelike curve $\zeta=\zeta(\vartheta)$
It is easy to show that the vectors of equiform Frenet frame are given as:

$$
\begin{gathered}
T(\varrho)=e^{\vartheta}\left(\frac{1}{\sqrt{2}} \cosh (\sqrt{2} \vartheta)+\sinh (\sqrt{2} \vartheta), \frac{1}{\sqrt{2}} \sinh (\sqrt{2} \vartheta)+\cosh (\sqrt{2} \vartheta), \frac{1}{\sqrt{2}}\right), \\
N(\varrho)=e^{\vartheta}(\sqrt{2} \cosh (\sqrt{2} \vartheta)+\sinh (\sqrt{2} \vartheta), \sqrt{2} \sinh (\sqrt{2} \vartheta)+\cosh (\sqrt{2} \vartheta), 0), \\
B(\varrho)=e^{\vartheta}\left(\frac{1}{\sqrt{2}} \cosh (\sqrt{2} \vartheta)+\sinh (\sqrt{2} \vartheta), \frac{1}{\sqrt{2}} \sinh (\sqrt{2} \vartheta)+\cosh (\sqrt{2} \vartheta), \frac{-1}{\sqrt{2}}\right) .
\end{gathered}
$$

Thus, the equiform Smarandache ruled surfaces $\Lambda(\vartheta, v), \Theta(\vartheta, v)$ and $\Upsilon(\vartheta, v)$ are respectively given as (see Figures 3, 4 and 5)

Figure 3: $T N$-equiform Smarandache developable ruled surface $\Lambda(\vartheta, v)$

$$
\begin{align*}
\Lambda(\vartheta, v)= & \left(\left(\frac{3+\sqrt{2} v e^{\vartheta}}{2}\right) \cosh (\sqrt{2} \vartheta)+\left(\frac{1+\sqrt{2} v e^{\vartheta}}{\sqrt{2}}\right) \sinh (\sqrt{2} \vartheta),\left(\frac{3+\sqrt{2} v e^{\vartheta}}{2}\right) \sinh (\sqrt{2} \vartheta)\right. \\
& \left.+\left(\frac{1+\sqrt{2} v e^{\vartheta}}{\sqrt{2}}\right) \cosh (\sqrt{2} \vartheta), \frac{1-v e^{\vartheta}}{\sqrt{2}}\right) . \tag{33}
\end{align*}
$$

Figure 4: $T B$-equiform Smarandache developable ruled surface $\Theta(\vartheta, v)$

$$
\begin{align*}
\Theta(\vartheta, v)=(1 & \left.+\sqrt{2} v e^{\vartheta}\right)\left(\cosh (\sqrt{2} \vartheta)+\sinh (\sqrt{2} \vartheta), \sinh (\sqrt{2} \vartheta)+\left(\frac{1+\sqrt{2} v e^{\vartheta}}{\sqrt{2}}\right) \cosh (\sqrt{2} \vartheta), 0\right) .  \tag{34}\\
\Upsilon(\vartheta, v)= & \left(\left(\frac{3+\sqrt{2} v e^{\vartheta}}{2}\right) \cosh (\sqrt{2} \vartheta)+\left(\frac{1+\sqrt{2} v e^{\vartheta}}{\sqrt{2}}\right) \sinh (\sqrt{2} \vartheta),\left(\frac{3+\sqrt{2} v e^{\vartheta}}{2}\right) \sinh (\sqrt{2} \vartheta)\right. \\
& \left.+\left(\frac{1+\sqrt{2} v e^{\vartheta}}{\sqrt{2}}\right) \cosh (\sqrt{2} \vartheta), \frac{v e^{\vartheta}-1}{\sqrt{2}}\right) \tag{35}
\end{align*}
$$

## 4. Conclusion

Using an equiform frame, various geometric characteristics of equiform Smarandache ruled surfaces in Minkowski space Minkowski 3-space are studied. We also provide the necessary requirements for these surfaces to be equiform developable and equiform minimal in relation to equiform curvatures, as well as when the equiform base curve is located in a plane or general helix.
