#### Abstract

A group is an algebraic system that characterizes symmetry. As a generalization of the concept of a group, semigroups and various non-associative groupoids can be considered as algebraic abstractions of generalized symmetry. In this paper, the notion of generalized Abel-Grassmann's neutrosophic extended triplet loop (GAG-NET-Loop) is proposed and some properties are discussed. In particular, the following conclusions are strictly proved: (1) an algebraic system is an AG-NET-Loop if and only if it is a strong inverse AG-groupoid; (2) an algebraic system is a GAG-NET-Loop if and only if it is a quasi strong inverse AG-groupoid; (3) an algebraic system is a weak commutative GAG-NET-Loop if and only if it is a quasi Clifford AG-groupoid; and (4) a finite interlaced AG-(l,l)-Loop is a strong AG-(l, 1)-Loop.

Keywords: Abel-Grassmann's neutrosophic extended triplet loop; generalized Abel-Grassmann's neutrosophic extended triplet loop; strong inverse AG-groupoid; quasi strong inverse AG-groupoid; quasi Clifford AG-groupoid

## 1. Introduction

The concept of an Abel-Grassmann's groupoid (AG-groupoid) was first given by Kazim and Naseeruddin [1] in 1972 and they have called it a left almost semigroup (LA-semigroup). In [2], the same structure is called a left invertive groupoid. In [3-9], some properties and different classes of an AG-groupoid are investigated.

Smarandache proposed the new concept of neutrosophic set, which is an extension of fuzzy set and intuitionistic fuzzy set [10]. Until now, neutrosophic sets have been applied to many fields such as decision making [11-13], forecasting [14], best product selection [15], the shortest path problem [16], minimum spanning tree [17], neutrosophic portfolios of financial assets [18], etc. Some new theoretical studies are also developed [19-24]. In [25], Xiaohong Zhang introduced the concept of Abel-Grassmann's neutrosophic extended triplet loop (AG-NET-loop), and some properties and structure about AG-NET-loop are discussed. Recently, a new algebraic system, generalized neutrosophic extended triplet set, is proposed in [26].

In this paper, we combine the notions of generalized neutrosophic extended triplet set and AG-groupoid, introduce the new concept of generalized Abel-Grassmann's neutrosophic extended triplet loop (GAG-NET-loop); that is, GAG-NET-loop is both AG-groupoid and generalized neutrosophic extended triplet set. We deeply analyze the internal connecting link between GAG-NETloop and other AG-groupoid and obtain some important results.

GAG-NET-loop is an extension of AG-NET-loop. Compared with AG-NET-loop, GAG-NET-loop relaxes the restriction on the elements in the AG-groupoid. According to our research, corresponding to the decomposition theorem of AG-NET-loop, some GAG-NET-loops can also be decomposed
into smaller ones. This is also the embodiment of the research method of regular semigroups to quasi-regular semigroups in non-associative groupoid.

The paper is organized as follows. Section 2 gives the basic definitions. Some properties about finite interlaced AG-(1,1)-Loop and some structures about strong inverse AG-groupoid are discussed in Section 3. We proposed the GAG-NET-Loop and discussed its properties and structure in Section 4. Finally, the summary and future work are presented in Section 5.

## 2. Basic Definitions

In this section, the related research and results of the AG-NET-loop are presented. Some related notions are introduced first.

Let $S$ be non-empty set, $*$ is a binary operation on $S$. If $\forall a, b \in S$, implies $a * b \in S$, then $(S, *)$ is called a groupoid. A groupoid $(S, *)$ is called an Abel-Grassmann's groupoid (AG-groupoid) [27,28] if it holds the left invertive law, that is, for all $a, b, c \in S,(a * b) * c=(c * b) * a$. In an AG-groupoid the medial law holds, for all $a, b, c, \in S,(a * b) *(c * d)=(a * c) *(b * d)$. In an AG-groupoid $(S, *)$, for all $a \in S, n \in Z^{+}$, the recursive definition of $a^{n}$ is as follows: $a^{1}=a, a^{2}=a * a, a^{3}=a^{2} * a=$ $(a * a) * a, a^{4}=a^{3} * a, \ldots, a^{n}=a^{n-1} * a$.

Definition 1 ([29]). Let $N$ be a non-empty set together with a binary operation $*$. Then, $N$ is called a neutrosophic extended triplet set if for any $a \in N$, there exists a neutral of " $a$ " (denoted by neut $(a)$ ), and an opposite of " $a$ " (denoted by anti $(a))$, such that neut $(a) \in N$, anti $(a) \in N$ and:

$$
\begin{gathered}
a * \operatorname{neut}(a)=\operatorname{neut}(a) * a=a, \\
a * \operatorname{anti}(a)=\operatorname{anti}(a) * a=\operatorname{neut}(a) .
\end{gathered}
$$

The triplet $(a, \operatorname{neut}(a)$, anti $(a))$ is called a neutrosophic extended triplet.
Note that, for a neutrosophic triplet set $(N, *), a \in N$, neut $(a)$ and anti(a) may not be unique. In order not to cause ambiguity, we use the following notations to distinguish: neut (a) denotes any certain one of neutral of $a$, \{neut $(a)\}$ denotes the set of all neutral of $a$, anti ( $a$ ) denotes any certain one of opposite of $a$, and $\{\operatorname{anti}(a)\}$ denotes the set of all opposite of $a$.

Definition $2([25])$. Let $(N, *)$ be a neutrosophic extended triplet set. Then, $N$ is called a neutrosophic extended triplet loop (NET-Loop), if $(N, *)$ is well-defined, i.e., for any $a, b \in N$, one has $a * b \in N$.

Definition 3 ([25]). Let $(N, *)$ be a neutrosophic extended triplet loop (NET-Loop). Then, $N$ is called an AG-NET-Loop, if $(N, *)$ is an AG-groupoid.

An AG-NET-Loop $N$ is called a commutative AG-NET-Loop if for all $a, b \in N, a * b=b * a$.
Theorem 1 ([25]). Let $(N, *)$ be an AG-NET-loop. Then, for any $x, y \in\{\operatorname{anti}(a)\}$,
(1) $\operatorname{neut}(a) * x=x * \operatorname{neut}(a)=\operatorname{neut}(a) * y$, that is, $\mid$ neut $(a) *\{\operatorname{anti}(a)\} \mid=1$.
(2) $(x * \operatorname{neut}(a)) * a=(\operatorname{neut}(a) * x) * a=\operatorname{neut}(a)$.
(3) $a *(x * \operatorname{neut}(a))=a *(\operatorname{neut}(a) * x)=\operatorname{neut}(a)$.
(4) $\forall a \in N$, neut $(a) * \operatorname{neut}(a)=\operatorname{neut}(a)$.

Definition 4 ([5]). An element a of an AG-groupoid $(S, *)$ is called a regular if there exists $x \in S$ such that $a=(a * x) * a$ and $S$ is called regular if all elements of $S$ are regular.

An AG-groupoid $(S, *)$ is called quasi regular if, for any $a \in S$, there exists a positive integer $n$ such that $a^{n}$ is regular.

Definition 5 ([6]). An element a of an AG-groupoid $(S, *)$ is called a fully regular element of $S$ if there exist some $p, q, r, s, t, u, v, w, x, y, z \in S(p, q, \ldots, z$ may be repeated) such that

$$
\begin{aligned}
a & =\left(p * a^{2}\right) * q=(r * a) *(a * s)=(a * t) *(a * u) \\
& =(a * a) * v=w *(a * a)=(x * a) *(y * a) \\
& =\left(a^{2} * z\right) * a^{2} .
\end{aligned}
$$

An AG-groupoid $(S, *)$ is called fully regular if all elements of $S$ are fully regular.
An AG-groupoid $(S, *)$ is called quasi fully regular if for any $a \in S$, there exists a positive integer $n$ such that $a^{n}$ is fully regular.

## 3. Strong Inverse AG-Groupoid and Finite Interlaced AG-Groupoid

Definition 6 ([30]). An AG-groupoid $(S, *)$ is called an inverse AG-groupoid if for each element a $\in S$, there exists an element $x$ in $S$ such that $a=(a * x) * a$ and $x=(x * a) * x$.

Definition 7. An AG-groupoid $(S, *)$ is called a strong inverse $A G$-groupoid if for any $a \in S$, there exists a unary operation $a \rightarrow a^{-1}$ on $S$ such that

$$
\left(a^{-1}\right)^{-1}=a, \quad\left(a * a^{-1}\right) * a=a *\left(a * a^{-1}\right)=a, \quad a * a^{-1}=a^{-1} * a
$$

The following example shows that an inverse AG-groupoid may not be a strong inverse AG-groupoid.

Example 1. Let $S=\{1,2,3,4\}$, an operation $*$ on $S$ is defined as in Table 1. Being $1=(1 * 3) * 1,3=$ $(3 * 1) * 3,2=(2 * 4) * 2,4=(4 * 2) * 4$, from Definition $6, S$ is an inverse AG-groupoid. Being $(1 * 1) * 1=$ $3 \neq 1,(1 * 2) * 1=4 \neq 1,(1 * 3) * 1=1 \neq 3=1 *(1 * 3),(1 * 4) * 1=2 \neq 1$, from Definition $7, S$ is not a strong inverse $A G$-groupoid.

Table 1. The operation table of Example 1.

| $\boldsymbol{*}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 4 | 3 | 1 |
| 2 | 3 | 1 | 2 | 4 |
| 3 | 1 | 3 | 4 | 2 |
| 4 | 4 | 2 | 1 | 3 |

Proposition 1. Let $(N, *)$ be an AG-NET-loop. Then, for any $a \in N, x \in\{\operatorname{anti}(a)\}$,

$$
\operatorname{neut}(\operatorname{neut}(a) * x) * \operatorname{anti}(\operatorname{neut}(a) * x)=a .
$$

Proof. For any $x \in\{\operatorname{anti}(a)\}$, we have

$$
\begin{aligned}
(\text { neut }(a) * x) * \operatorname{neut}(a) & =(\text { neut }(a) * x) *(a * x) \\
& =(\text { neut }(a) * a) *(x * x) \quad \text { (applying the medial law) } \\
& =(a * \operatorname{neut}(a)) *(x * x) \\
& =(a * x) *(\text { neut }(a) * x) \quad(\text { applying the medial law }) \\
& =\operatorname{neut}(a) *(\text { neut }(a) * x),
\end{aligned}
$$

$$
\begin{aligned}
\operatorname{neut}(a) *(\operatorname{neut}(a) * x) & =(x * a) *(\operatorname{neut}(a) * x) \\
& =(x * \operatorname{neut}(a)) *(a * x) \quad \text { (applying the medial law) } \\
& =(x * \operatorname{neut}(a)) * \operatorname{neut}(a) \\
& =(\text { neut }(a) * \operatorname{neut}(a)) * x \\
& =\operatorname{neut}(a) * x, \quad(\text { by Proposition } 1(4))
\end{aligned}
$$

we have $(\operatorname{neut}(a) * x) * \operatorname{neut}(a)=\operatorname{neut}(a) *(\operatorname{neut}(a) * x)=\operatorname{neut}(a) * x$.
From Theorem 1 (2) and (3), we have

$$
\operatorname{neut}(\operatorname{neut}(a) * x)=\operatorname{neut}(a), a \in \operatorname{anti}\{\operatorname{neut}(a) * x\} .
$$

From Theorem 1 (1) neut $(a) * x$ is unique, we have

$$
\operatorname{neut}(\operatorname{neut}(a) * x) * \operatorname{anti}(\operatorname{neut}(a) * x)=\operatorname{neut}(a) * a=a .
$$

Example 2. Let $N=\{a, b, c\}$, an operation $*$ on $N$ is defined as in Table 2. Since neut $(a)=a$, anti $(a)=$ $a$, neut $(b)=a, \operatorname{anti}(b)=c, \operatorname{neut}(c)=a, \operatorname{anti}(c)=b$, so $(N, *)$ is an AG-NET-Loop. Being

$$
\begin{gathered}
\operatorname{neut}(\operatorname{neut}(a) * a) * \operatorname{anti}(\operatorname{neut}(a) * a)=a * a=a \\
\operatorname{neut}(\operatorname{neut}(b) * c) * \operatorname{anti}(\operatorname{neut}(b) * c)=\operatorname{neut}(c) * \operatorname{anti}(c)=b, \\
\operatorname{neut}(\operatorname{neut}(c) * b) * \operatorname{anti}(\operatorname{neut}(c) * b)=\operatorname{neut}(b) * \operatorname{anti}(b)=c,
\end{gathered}
$$

that is for any $a \in N, x \in\{\operatorname{anti}(a)\}, \operatorname{neut}(\operatorname{neut}(a) * x) * \operatorname{anti}(\operatorname{neut}(a) * x)=a$.
Table 2. An AG-NET-Loop of Example 2.

| $*$ | $\boldsymbol{a}$ | $\boldsymbol{b}$ | $\boldsymbol{c}$ |
| :---: | :---: | :---: | :---: |
| $a$ | $a$ | $b$ | $c$ |
| $b$ | $b$ | $c$ | $a$ |
| $c$ | $c$ | $a$ | $b$ |

Theorem 2. Let $(N, *)$ be a groupoid. Then, $N$ is an AG-NET-Loop if and only if it is a strong inverse AG-groupoid.

Proof. Necessity: Suppose $N$ is an AG-NET-Loop, from Definition 3, for each $a \in N$, such that $a$ has the neutral element and opposite element, denoted by neut (a) and anti(a), respectively. Set

$$
a^{-1}=n e u t(a) * \operatorname{anti}(a)
$$

by Theorem $1(1)$, neut $(a) * \operatorname{anti}(a)$ is unique, so $a^{-1}$ is unique. By Proposition 1, we have

$$
\left(a^{-1}\right)^{-1}=\operatorname{neut}(\operatorname{neut}(a) * \operatorname{anti}(a)) * \operatorname{anti}(\operatorname{neut}(a) * \operatorname{anti}(a))=a .
$$

Being

$$
a^{-1} * a=(\operatorname{neut}(a) * \operatorname{anti}(a)) * a=(a * \operatorname{anti}(a)) * \operatorname{neut}(a)=\operatorname{neut}(a) * \text { neut }(a)=\operatorname{neut}(a),
$$

$$
\begin{array}{rl}
a * a^{-1} & =a *(\operatorname{neut}(a) * \operatorname{anti}(a)) \\
& =(\operatorname{neut}(a) * a) *(\operatorname{neut}(a) * \operatorname{anti}(a)) \\
& =(\operatorname{neut}(a) * \operatorname{neut}(a)) *(a * \operatorname{anti}(a)) \\
& =(\operatorname{neut}(a) * \operatorname{neut}(a)) * \operatorname{neut}(a) \\
& =\operatorname{neut}(a), \\
\left(a * a^{-1}\right) * a=\operatorname{neut}(a) * a=a, \\
a & *\left(a * a^{-1}\right)=a * \operatorname{neut}(a)=a,
\end{array}
$$

we have

$$
\begin{gathered}
a^{-1} * a=a * a^{-1} \\
\left(a * a^{-1}\right) * a=a *\left(a * a^{-1}\right)=a
\end{gathered}
$$

From Definition 7, $N$ is a strong inverse AG-groupoid.
Sufficiency: If $N$ is a strong inverse AG-groupoid and $a^{-1} \in N$, such that $a * a^{-1}=a^{-1} * a$ and $\left(a * a^{-1}\right) * a=a *\left(a * a^{-1}\right)=a$. Set

$$
\operatorname{neut}(a)=a * a^{-1}
$$

then $\operatorname{neut}(a) * a=\left(a * a^{-1}\right) * a=a *\left(a * a^{-1}\right)=a * \operatorname{neut}(a)=a, a *(a)^{-1}=(a)^{-1} * a=\operatorname{neut}(a)$. From Definition 3, we have that $N$ is an AG-NET-Loop and $a^{-1} \in\{\operatorname{anti}(a)\}$.

Example 3. Apply $(S, *)$ in Example 2, we know that it is an AG-NET-Loop. We show that it is a strong inverse $A G$-groupoid in the following.

For $b$, there exists a inverse element $b^{-1}=c$, such that $\left(b^{-1}\right)^{-1}=b,\left(b * b^{-1}\right) * b=b *\left(b * b^{-1}\right)=$ $b, b * b^{-1}=b^{-1} * b=a$, so $b$ is strong inverse. $a$ and $c$ are strong inverse for the same reason, so $(S, *)$ is a strong inverse $A G$-groupoid by Definition 7 .

An AG-groupoid $(\mathrm{S}, *)$ is called interlaced if it satisfies $(a * a) * b=a *(a * b), a *(b * b)=(a * b) * b$ for all $a, b$ in S. An AG-groupoid (S, $\left.{ }^{*}\right)$ is called locally associative if it satisfies $(a * a) * a=a *(a * a)$ for all $a$ in $S$.

Theorem 3. Let $(D, *)$ be a locally associative $A G$-groupoid with respect to *. If $D$ is finite, there is an idempotent element in $D$. That is, $\exists a \in D, a * a=a$.

Proof. Assume that $D$ is a finite locally associative AG-groupoid with respect to *. Then, for any $a \in D$, $a, a * a=a^{2}, a * a * a=a^{3}, \ldots, a^{n}, \ldots \in D$. Since $D$ is finite, there exists natural number $m, k$ such that $a^{m}=a^{m+k}$.

Case 1: If $k=m$, then $a^{m}=a^{2 m}$, that is, $a^{m}=a^{m} * a^{m}, a^{m}$ is an idempotent element in $D$.
Case 2: If $k>m$, then from $a^{m}=a^{m+k}$ we can get

$$
a^{k}=a^{m} * a^{k-m}=a^{m+k} * a^{k-m}=a^{2 k}=a^{k} * a^{k} .
$$

This means that $a^{k}$ is an idempotent element in $D$.
Case 3: If $k<m$, then from $a^{m}=a^{m+k}$ we can get

$$
\begin{gathered}
a^{m}=a^{m+k}=a^{m} * a^{k}=a^{m+k} * a^{k}=a^{m+2 k} ; \\
a^{m}=a^{m+2 k}=a^{m} * a^{2 k}=a^{m+k} * a^{2 k}=a^{m+3 k}
\end{gathered}
$$

$$
a^{m}=a^{m+m k}
$$

Since $m$ and $k$ are natural numbers, then $m k \geq m$. Therefore, from $a^{m}=a^{m+m k}$, applying Case 1 or Case 2, we know that there exists an idempotent element in $D$.

Definition 8 ([31]). Let $(N, *)$ be an AG-groupoid. Then, $N$ is called an AG-(l,l)-Loop, if for any a $\in N$, there exist two elements $b$ and $c$ in $N$ that satisfy the condition: $b * a=a$, and $c * a=b$. In an $A G-(l, l)$-Loop, a neutral of " $a$ " denoted by neut $(l, l)$ (a).

Definition 9 ([31]). Let $(N, *)$ be an $A G-(l, l)$-Loop. Then, $N$ is a strong $A G-(l, l)$-Loop if neut $(l, l)(a) *$ $\operatorname{neut}_{(l, l)}(a)=$ neut $_{(l, l)}(a), \forall a \in N$.

Definition 10. Let $(D, *)$ be an AG- $(l, l)$-Loop. Then, $D$ is called an interlaced $A G-(l, l)$-Loop, if it satisfies $(a *$ $a) * b=a *(a * b), a *(b * b)=(a * b) * b$, for all $a, b$ in $D$.

Theorem 4. Let $(D, *)$ be an interlaced $A G-(l, l)$-Loop with respect to ${ }^{*}$. If $D$ is finite, there is an idempotent left neutral element in $D$. That is, $\forall a \in D, \exists s, p \in D, s * a=a, p * a=s, s * s=s$.

Proof. Assume that $D$ is a finite interlaced AG-(1,1)-Loop with respect to *. Then, for any $a \in D$, $\exists s, p \in D, s * a=a, p * a=s$, we have $s * a=(p * a) * a=(a * a) * p=a *(a * p)=a$,

$$
\begin{aligned}
& a * s=(a *(a * p)) * s \\
&=(s *(a * p)) * a \quad \text { (by the left invertive law) } \\
&=((p * a) *(a * p)) * a \\
&=(((a * p) * a) * p) * a \quad \text { (by the left invertive law) } \\
&=(a * p) *((a * p) * a) \quad \text { (by the left invertive law) } \\
&=((a * p) *(a * p)) * a \quad \text { (by the interlaced law) } \\
&=(a *(a * p)) *(a * p) \quad \text { (by the left invertive law) } \\
&= a *(a * p)=a \\
& s^{2} * a=(s * s) * a=(a * s) * s=a \\
& s^{3} * a=\left(s^{2} * s\right) * a=(a * s) * s^{2}=a * s^{2}=a *(s * s)=(a * s) * s=a * s=a .
\end{aligned}
$$

When $m>3, m \equiv 0(\bmod 2)$, we have

$$
\begin{aligned}
s^{m} * a & =\left(s^{m-2} * s^{2}\right) * a \\
& =\left(a * s^{2}\right) * s^{m-2} \\
& =a * s^{m-2} \\
& =a *\left(s^{(m-2) / 2} * s^{(m-2) / 2}\right) \\
& =\left(a * s^{(m-2) / 2}\right) * s^{(m-2) / 2} \quad(b y \text { the interlaced law }) \\
& \left.=\left(s^{(m-2) / 2} * s^{(m-2) / 2}\right) * a \quad \text { (by the left invertive law }\right) \\
& =s^{m-2} * a \\
& =\ldots \ldots \\
& =s^{2} * a=a
\end{aligned}
$$

When $m>3, m \equiv 1(\bmod 2)$, we have

$$
\begin{aligned}
s^{m} * a & =\left(s^{m-1} * s\right) * a \\
& =(a * s) * s^{m-1} \\
& =a * s^{m-1} \\
& =a *\left(s^{(m-1) / 2} * s^{(m-1) / 2}\right) \\
& =\left(a * s^{(m-1) / 2}\right) * s^{(m-1) / 2} \quad(b y \text { the interlaced law }) \\
& =\left(s^{(m-1) / 2} * s^{(m-1) / 2}\right) * a \\
& =s^{m-1} * a \\
& =\ldots \ldots . \\
& =s^{2} * a=a .
\end{aligned}
$$

Thus, $s, s^{2}, s^{3}$. .$s^{m}$. $\qquad$ are all left neutral element.
Applying Theorem 3, we know that there exists an idempotent left neutral element in $D$.
Theorem 5. Assume that $(N, *)$ is a finite interlaced $A G-(l, l)$-Loop. Then, for all a in $N$, if neut $(l, l)$ ( $a)$ is an idempotent element, then it is unique.

Proof. Assume that $N$ is a finite interlaced AG-(l,l)-Loop with respect to *. Suppose that there exist $x, y \in\left\{\right.$ neut $\left._{(l, l)}(a)\right\}, a \in N$. By Definition $8, x * a=a, y * a=a$, and there exist $p, q \in N$ which satisfy $p * a=x, q * a=y$. If $x * x=x, y * y=y$, we have

$$
\begin{gathered}
x=x * x=(p * a) * x=(x * a) * p=a * p \\
y=y * y=(q * a) * y=(y * a) * q=a * q \\
x * y=(p * a) * y=(y * a) * p=a * p=x \\
y * x=(q * a) * x=(x * a) * q=a * q=y \\
x=x * y=(x * x) * y=(y * x) * x=y * x=y
\end{gathered}
$$

We know that $x=y, \operatorname{neut}_{(l, l)}(a)$ is unique.
Theorem 6. Let $(N, *)$ be a finite interlaced $A G-(l, l)$-Loop. Then, $N$ is a strong $A G-(l, l)$-Loop.
Proof. For any $a$ in $N$, applying Theorem 4, we have $\exists s, p \in N, s * a=a, p * a=s, s * s=s$. From this and Definition 9 , we know that $N$ is a strong AG-(1,1)-Loop.

Example 4. Let $S=\{1,2,3\}$, an operation $*$ on $S$ is defined as in Table 3. Being $(1 * 1) * 2=1 *(1 * 2)=$ $2,1 *(2 * 2)=(1 * 2) * 2=3,(1 * 1) * 3=1 *(1 * 3)=3,1 *(3 * 3)=(1 * 3) * 3=2,(2 * 2) * 3=$ $2 *(2 * 3)=2,2 *(3 * 3)=(2 * 3) * 3=3$, and $1 * 1=1,1 * 2=2,3 * 2=1,1 * 3=3,2 * 3=1$, we have $S$ is a finite interlaced $A G-(l, l)$-Loop by Definition 10. Being neut ${ }_{(l, l)}(1)=\operatorname{neut}_{(l, l)}(2)=\operatorname{neut}_{(l, l)}(3)=1$, $1^{*} 1=1$, we have $S$ is a strong $A G-(l, l)$-Loop by Definition 9.

Table 3. A finite interlaced AG-(l,l)-Loop of Example 4.

| $*$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ |
| :--- | :--- | :--- | :--- |
| 1 | 1 | 2 | 3 |
| 2 | 2 | 3 | 1 |
| 3 | 3 | 1 | 2 |

The following example shows that a strong AG-(l,1)-Loop may not be an interlaced AG-(l,1)-Loop.
Example 5. Let $S=\{1,2,3\}$, an operation $*$ on $S$ is defined as in Table 4. Being $1 * 1=1,1 * 2=2,2 * 2=$ $1,1 * 3=3,3 * 3=1$, we have $S$ is a strong $A G$-(l,l)-Loop by Definition 9. However, it is not an interlaced AG-(l,l)-Loop because $2 *(3 * 3)=3 \neq 2=(2 * 3) * 3$.

Table 4. A strong AG-(l,l)-Loop of Example 5.

| $*$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ |
| :--- | :--- | :--- | :--- |
| 1 | 1 | 2 | 3 |
| 2 | 3 | 1 | 2 |
| 3 | 2 | 3 | 1 |

## 4. GAG-NET-Loop

Definition 11 ([26]). Let $N$ be a non-empty set together with a binary operation $*$. Then, $N$ is called a generalized neutrosophic extended triplet set if for any $a \in N$, at least exists a positive integer $n$, $a^{n}$ exists neutral element (denoted by neut $\left(a^{n}\right)$ ) and opposite element (denoted by anti( $\left.a^{n}\right)$ ), such that $\operatorname{neut}\left(a^{n}\right) \in N, \operatorname{anti}\left(a^{n}\right) \in N$ and

$$
a^{n} * \operatorname{neut}\left(a^{n}\right)=\operatorname{neut}\left(a^{n}\right) * a^{n}=a^{n}, a^{n} * \operatorname{anti}\left(a^{n}\right)=\operatorname{anti}\left(a^{n}\right) * a^{n}=\operatorname{neut}\left(a^{n}\right)
$$

The triplet $\left(a, n e u t\left(a^{n}\right), \operatorname{anti}\left(a^{n}\right)\right)$ is called a generalized neutrosophic extended triplet with degree $n$.
Definition 12. Let $(N, *)$ be a generalized neutrosophic extended triplet set. Then, $N$ is called a generalized Abel-Grassmann's neutrosophic extended triplet loop (GAG-NET-Loop), if the following conditions are satisfied: for all $a, b, c \in N,(a * b) * c=(c * b) * a$.

A GAG-NET-Loop $N$ is called a commutative GAG-NET-Loop if for all $a, b \in N, a * b=b * a$.
Example 6. Let $S=\{a, b, c\}$, an operation $*$ on $S$ is defined as in Table 5 . We can see that $(a, a, a),(a, a, b)$, and $(a, a, c)$ are neutrosophic extended triplets, but $b$ and $c$ do not have the neutral element and opposite element. Thus, $S$ is not an AG-NET-Loop. Moreover, $b^{2}=c^{2}=a$ has the neutral element and opposite element, thus $(S, *)$ is a GAG-NET-Loop. $(b, a, a)$ and $(c, a, a)$ are generalized neutrosophic extended triplets with degree 2. We can infer that $(S, *)$ is a GAG-NET-Loop but not an AG-NET-Loop. Moreover it is not a commutative GAG-NET-Loop being $b * c \neq c * b$.

Table 5. A GAG-NET-Loop of Example 6.

The algebraic system $\left(Z_{n}, \otimes\right), \otimes$ is the classical $\bmod$ multiplication, where $Z_{n}=\{[0],[1], \cdots,[n-$ 1] $\}$ and $n \in Z^{+}, n \geq 2$.

Example 7. Consider $\left(Z_{4}, \otimes\right)$, an operation $\otimes$ on $Z_{4}$ is defined as in Table 6. We have:
(1) [0], [1] and [3] have the neutral element and opposite element.
(2) [2] does not have the neutral element and opposite element, but we can see that $[2]^{2}=[0]$ has the neutral element and opposite element.

Table 6. The operation table of $Z_{4}$.

| $\otimes$ | $[0]$ | $[1]$ | $[2]$ | $[3]$ |
| :---: | :---: | :---: | :---: | :---: |
| $[0]$ | $[0]$ | $[0]$ | $[0]$ | $[0]$ |
| $[1]$ | $[0]$ | $[1]$ | $[2]$ | $[3]$ |
| $[2]$ | $[0]$ | $[2]$ | $[0]$ | $[2]$ |
| $[3]$ | $[0]$ | $[3]$ | $[2]$ | $[1]$ |

Thus, $Z_{4}$ is a generalized neutrosophic extended triplet set, but it is not a neutrosophic extended triplet set. Moreover, $\left(Z_{4}, \otimes\right)$ is a commutative GAG-NET-Loop.

Proposition 2. Let $(N, *)$ be a GAG-NET-Loop, $a \in N$ and ( $a$, neut $\left(a^{n}\right)$, anti $\left(a^{n}\right)$ ) is a generalized neutrosophic extended triplet with degree $n$. We have:
(1) neut ( $a^{n}$ ) is unique.
(2) $\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(a^{n}\right)=\operatorname{neut}\left(a^{n}\right)$.

Proof. Assume $c, d \in\left\{\operatorname{neut}\left(a^{n}\right)\right\}$, so $a^{n} * c=c * a^{n}=a^{n}, a^{n} * d=d * a^{n}=a^{n}$, and there exists $x, y \in N$ such that

$$
a^{n} * x=x * a^{n}=c, a^{n} * y=y * a^{n}=d
$$

We can obtain

$$
\begin{aligned}
c * d=\left(x * a^{n}\right) & * d=\left(d * a^{n}\right) * x=a^{n} * x=c \\
c * d & =\left(a^{n} * x\right) *\left(y * a^{n}\right) \\
& =\left(a^{n} * y\right) *\left(x * a^{n}\right) \\
& =\left(a^{n} * y\right) * c \\
& =\left(y * a^{n}\right) * c \\
& =\left(c * a^{n}\right) * y \\
& =a^{n} * y=d
\end{aligned}
$$

We have $c=d=c * d$. Thus, neut $\left(a^{n}\right)$ is unique and neut $\left(a^{n}\right) * \operatorname{neut}\left(a^{n}\right)=\operatorname{neut}\left(a^{n}\right)$.
Proposition 3. Let $(N, *)$ be a GAG-NET-Loop, $a \in N$ and $\left(a\right.$, neut $\left(a^{n}\right)$, anti( $\left.a^{n}\right)$ ) is a generalized neutrosophic extended triplet with degree $n$. Then,
(1) $\left(a^{n} * a^{n}\right) * a^{n}=a^{n} *\left(a^{n} * a^{n}\right)$.
(2) $\operatorname{neut}\left(a^{n}\right) * x=\operatorname{neut}\left(a^{n}\right) * y$, for any $x, y \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$.
(3) $\operatorname{neut}\left(\operatorname{neut}\left(a^{n}\right)\right)=\operatorname{neut}\left(a^{n}\right)$.
(4) $a^{n} *\left(x * \operatorname{neut}\left(a^{n}\right)\right)=\left(x * \operatorname{neut}\left(a^{n}\right)\right) * a^{n}=\operatorname{neut}\left(a^{n}\right)$, for any $x \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$.
(5) $a^{n} *\left(\operatorname{neut}\left(a^{n}\right) * x\right)=\left(\operatorname{neut}\left(a^{n}\right) * x\right) * a^{n}=\operatorname{neut}\left(a^{n}\right)$, for any $x \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$.
(6) $\left.\operatorname{(neut}\left(a^{n}\right) * x\right) * \operatorname{neut}\left(a^{n}\right)=\operatorname{neut}\left(a^{n}\right) *\left(\operatorname{neut}\left(a^{n}\right) * x\right)=\operatorname{neut}\left(a^{n}\right) * x$, for any $x \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$.
(7) $\operatorname{neut}\left(\operatorname{neut}\left(a^{n}\right) * x\right) * \operatorname{anti}\left(\operatorname{neut}\left(a^{n}\right) * x\right)=a^{n}$, for any $x \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$.

## Proof.

(1) For $a \in N, \operatorname{neut}\left(a^{n}\right) * a^{n}=a^{n} * \operatorname{neut}\left(a^{n}\right)=a^{n}$, we have

$$
\left(a^{n} * a^{n}\right) * a^{n}=\left(a^{n} * a^{n}\right) *\left(\operatorname{neut}\left(a^{n}\right) * a^{n}\right)=\left(a^{n} * \operatorname{neut}\left(a^{n}\right)\right) *\left(a^{n} * a^{n}\right)=a^{n} *\left(a^{n} * a^{n}\right) .
$$

(2) For any $x, y \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$, we have neut $\left(a^{n}\right) * x=\left(y * a^{n}\right) * x=\left(x * a^{n}\right) * y=\operatorname{neut}\left(a^{n}\right) * y$.
(3) From Proposition 2, we have neut ( $a^{n}$ ) exists neutral element and opposite element. For any $x \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$ and $y \in\left\{\operatorname{anti}\left(\operatorname{neut}\left(a^{n}\right)\right)\right\}$,

$$
(y * x) * a^{n}=\left(a^{n} * x\right) * y=\operatorname{neut}\left(a^{n}\right) * y=\operatorname{neut}\left(\operatorname{neut}\left(a^{n}\right)\right)
$$

Moreover,

$$
\begin{aligned}
\left((y * x) * a^{n}\right) * \operatorname{neut}\left(a^{n}\right) & =\left(\operatorname{neut}\left(a^{n}\right) * y\right) * \operatorname{neut}\left(a^{n}\right) \\
& =\left(y * \operatorname{neut}\left(a^{n}\right)\right) * \operatorname{neut}\left(a^{n}\right) \\
& =\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(a^{n}\right)\right) * y \\
& =\operatorname{neut}\left(a^{n}\right) * y \\
& =\operatorname{neut}\left(\operatorname{neut}\left(a^{n}\right)\right) .
\end{aligned}
$$

Thus, $\operatorname{neut}\left(a^{n}\right)=\operatorname{neut}\left(\operatorname{neut}\left(a^{n}\right)\right) * \operatorname{neut}\left(a^{n}\right)=\left((y * x) * a^{n}\right) * \operatorname{neut}\left(a^{n}\right)=\operatorname{neut}\left(\operatorname{neut}\left(a^{n}\right)\right)$.
(4) For any $x \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$, from Definition 11 and Proposition 2, we have

$$
\begin{aligned}
& a^{n} *\left(x * \operatorname{neut}\left(a^{n}\right)\right)=\left(a^{n} * \operatorname{neut}\left(a^{n}\right)\right) *\left(x * \operatorname{neut}\left(a^{n}\right)\right) \\
&=\left(a^{n} * x\right) *\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(a^{n}\right)\right) \\
&=\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(a^{n}\right) \\
&=\operatorname{neut}\left(a^{n}\right), \\
&\left(x * \operatorname{neut}\left(a^{n}\right)\right) * a^{n}=\left(a^{n} * \operatorname{neut}\left(a^{n}\right)\right) * x=a^{n} * x=\operatorname{neut}\left(a^{n}\right) .
\end{aligned}
$$

Thus, $a^{n} *\left(x * \operatorname{neut}\left(a^{n}\right)\right)=\left(x * \operatorname{neut}\left(a^{n}\right)\right) * a^{n}=\operatorname{neut}\left(a^{n}\right)$, for any $x \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$.
(5) For any $x \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$, we have

$$
\begin{aligned}
\left(\operatorname{neut}\left(a^{n}\right) * x\right) * a^{n} & =\left(\operatorname{neut}\left(a^{n}\right) * x\right) *\left(\operatorname{neut}\left(a^{n}\right) * a^{n}\right) \\
& =\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(a^{n}\right)\right) *\left(x * a^{n}\right) \\
& =\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(a^{n}\right) \\
& =\operatorname{neut}\left(a^{n}\right), \\
a^{n} *\left(\operatorname{neut}\left(a^{n}\right) * x\right) & =\left(\operatorname{neut}\left(a^{n}\right) * a^{n}\right) *\left(\operatorname{neut}\left(a^{n}\right) * x\right) \\
& =\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(a^{n}\right)\right) *\left(a^{n} * x\right) \\
& =\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(a^{n}\right) \\
& =\operatorname{neut}\left(a^{n}\right) .
\end{aligned}
$$

Thus, $a^{n} *\left(\operatorname{neut}\left(a^{n}\right) * x\right)=\left(\operatorname{neut}\left(a^{n}\right) * x\right) * a^{n}=\operatorname{neut}\left(a^{n}\right)$.
(6) For any $x \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$, we have

$$
\begin{aligned}
\left(\text { neut }\left(a^{n}\right) * x\right) * \operatorname{neut}\left(a^{n}\right) & =\left(\operatorname{neut}\left(a^{n}\right) * x\right) *\left(a^{n} * x\right) \\
& =\left(\operatorname{neut}\left(a^{n}\right) * a^{n}\right) *(x * x) \\
& =\left(a^{n} * \operatorname{neut}\left(a^{n}\right)\right) *(x * x) \\
& =\left(a^{n} * x\right) *\left(\operatorname{neut}\left(a^{n}\right) * x\right) \\
& =\operatorname{neut}\left(a^{n}\right) *\left(\operatorname{neut}\left(a^{n}\right) * x\right), \\
\operatorname{neut}\left(a^{n}\right) *\left(\operatorname{neut}\left(a^{n}\right) * x\right) & =\left(x * a^{n}\right) *\left(\text { neut }\left(a^{n}\right) * x\right) \\
& =\left(x * \operatorname{neut}\left(a^{n}\right)\right) *\left(a^{n} * x\right) \\
& =\left(x * \operatorname{neut}\left(a^{n}\right)\right) * \operatorname{neut}\left(a^{n}\right) \\
& =\left(\text { neut }\left(a^{n}\right) * \text { neut }\left(a^{n}\right)\right) * x \\
& =\operatorname{neut}\left(a^{n}\right) * x .
\end{aligned}
$$

Thus, $\left(\operatorname{neut}\left(a^{n}\right) * x\right) * \operatorname{neut}\left(a^{n}\right)=\operatorname{neut}\left(a^{n}\right) *\left(\operatorname{neut}\left(a^{n}\right) * x\right)=\operatorname{neut}\left(a^{n}\right) * x$.
(7) From (5) and (6), we have neut $\left(\operatorname{neut}\left(a^{n}\right) * x\right)=\operatorname{neut}\left(a^{n}\right)$, $a^{n} \in \operatorname{anti}\left\{\operatorname{neut}\left(a^{n}\right) * x\right\}$. From (2), $\operatorname{neut}\left(a^{n}\right) * \operatorname{anti}\left(a^{n}\right)$ is unique, we have

$$
\operatorname{neut}\left(\operatorname{neut}\left(a^{n}\right) * x\right) * \operatorname{anti}\left(\operatorname{neut}\left(a^{n}\right) * x\right)=\operatorname{neut}\left(\operatorname{neut}\left(a^{n}\right) * x\right) * a^{n}=\operatorname{neut}\left(a^{n}\right) * a^{n}=a^{n}
$$

Example 8. Let $S=\{a, b, c, d\}$, an operation $*$ on $S$ is defined as in Table 7. Since neut $(a)=a,\{\operatorname{anti}(a)\}=$ $\{a, b, c\}, \operatorname{neut}(d)=a$, anti $(d)=d$ and $b^{2}=a, c^{2}=a$, so $(S, *)$ is a GAG-NET-Loop. We can get that (Corresponding to the results of Proposition 3):

Table 7. A GAG-NET-Loop of Example 8.

| $*$ | $\boldsymbol{a}$ | $\boldsymbol{b}$ | $\boldsymbol{c}$ | $\boldsymbol{d}$ |
| :--- | :--- | :--- | :--- | :--- |
| $a$ | $a$ | $a$ | $a$ | $d$ |
| $b$ | $a$ | $a$ | $c$ | $d$ |
| $c$ | $a$ | $b$ | $a$ | $d$ |
| $d$ | $d$ | $d$ | $d$ | $a$ |

(1) $\operatorname{Being}\left(b^{2} * b^{2}\right) * b^{2}=b^{2} *\left(b^{2} * b^{2}\right),\left(d^{1} * d^{1}\right) * d^{1}=d^{1} *\left(d^{1} * d^{1}\right)$, that is $\left(a^{n} * a^{n}\right) * a^{n}=a^{n} *\left(a^{n} * a^{n}\right)$.
(2) Being $a * a=a * b=a * c$, that is for any $x, y \in\left\{\operatorname{anti}\left(c^{2}\right)\right\}$, neut $\left(c^{2}\right) * x=\operatorname{neut}\left(c^{2}\right) * y$.
(3) Being neut $\left(\operatorname{neut}\left(a^{1}\right)\right)=\operatorname{neut}\left(a^{1}\right)=a$, neut $\left(\operatorname{neut}\left(d^{1}\right)\right)=\operatorname{neut}\left(d^{1}\right)=a$, neut $\left(\operatorname{neut}\left(b^{2}\right)\right)=$ $\operatorname{neut}\left(b^{2}\right)=a$, neut $\left(\operatorname{neut}\left(c^{2}\right)\right)=\operatorname{neut}\left(c^{2}\right)=a$, that is neut $\left(\operatorname{neut}\left(a^{n}\right)\right)=\operatorname{neut}\left(a^{n}\right)$.
(4) Being $c^{2} *\left(a * \operatorname{neut}\left(c^{2}\right)\right)=a,\left(a * \operatorname{neut}\left(c^{2}\right)\right) * c^{2}=a=\operatorname{neut}\left(c^{2}\right), c^{2} *\left(b * \operatorname{neut}\left(c^{2}\right)\right)=a,(b *$ $\left.\operatorname{neut}\left(c^{2}\right)\right) * c^{2}=a=\operatorname{neut}\left(c^{2}\right), c^{2} *\left(c * \operatorname{neut}\left(c^{2}\right)\right)=a,\left(c * \operatorname{neut}\left(c^{2}\right)\right) * c^{2}=a=\operatorname{neut}\left(c^{2}\right)$, that is $c^{2} *$ $\left(x * \operatorname{neut}\left(c^{2}\right)\right)=\left(x * \operatorname{neut}\left(c^{2}\right)\right) * c^{2}=\operatorname{neut}\left(c^{2}\right)$, for any $x \in\left\{\operatorname{anti}\left(c^{2}\right)\right\}$. Being $d^{1} *\left(d * \operatorname{neut}\left(d^{1}\right)\right)=$ $a,\left(d * \operatorname{neut}\left(d^{1}\right)\right) * d^{1}=a=\operatorname{neut}\left(d^{1}\right)$, that is $d^{1} *\left(x * \operatorname{neut}\left(d^{1}\right)\right)=\left(x * \operatorname{neut}\left(d^{1}\right)\right) * d^{1}=\operatorname{neut}\left(d^{1}\right)$, for any $x \in\left\{\operatorname{anti}\left(d^{1}\right)\right\}$.
(5) Being $c^{2} *\left(\operatorname{neut}\left(c^{2}\right) * a\right)=a,\left(\operatorname{neut}\left(c^{2}\right) * a\right) * c^{2}=a=\operatorname{neut}\left(c^{2}\right), c^{2} *\left(\operatorname{neut}\left(c^{2}\right) * b\right)=a$, (neut $\left(c^{2}\right) *$ b) $* c^{2}=a=\operatorname{neut}\left(c^{2}\right), c^{2} *\left(\operatorname{neut}\left(c^{2}\right) * c\right)=a,\left(\operatorname{neut}\left(c^{2}\right) * c\right) * c^{2}=a=\operatorname{neut}\left(c^{2}\right)$, that is $c^{2} *$ $\left(\operatorname{neut}\left(c^{2}\right) * x\right)=\left(\operatorname{neut}\left(c^{2}\right) * x\right) * c^{2}=\operatorname{neut}\left(c^{2}\right)$, for any $x \in\left\{\operatorname{anti}\left(c^{2}\right)\right\}$. Being $d^{1} *\left(\operatorname{neut}\left(d^{1}\right) * d\right)=$ $a,\left(\operatorname{neut}\left(d^{1}\right) * d\right) * d^{1}=a=\operatorname{neut}\left(d^{1}\right)$, that is $d^{1} *\left(\operatorname{neut}\left(d^{1}\right) * x\right)=\left(\operatorname{neut}\left(d^{1}\right) * x\right) * d^{1}=\operatorname{neut}\left(d^{1}\right)$, for any $x \in\left\{\operatorname{anti}\left(d^{1}\right)\right\}$.
(6) Being neut $\left(c^{2}\right) * a=a,\left(\operatorname{neut}\left(c^{2}\right) * a\right) * \operatorname{neut}\left(c^{2}\right)=a$, neut $\left(c^{2}\right) *\left(\operatorname{neut}\left(c^{2}\right) * a\right)=a$; neut $\left(c^{2}\right) * b=a$, $\left(\operatorname{neut}\left(c^{2}\right) * b\right) * \operatorname{neut}\left(c^{2}\right)=a, \operatorname{neut}\left(c^{2}\right) *\left(\operatorname{neut}\left(c^{2}\right) * b\right)=a ; \operatorname{neut}\left(c^{2}\right) * c=a,\left(\operatorname{neut}\left(c^{2}\right) * c\right) *$ $\operatorname{neut}\left(c^{2}\right)=a, \operatorname{neut}\left(c^{2}\right) *\left(\operatorname{neut}\left(c^{2}\right) * a\right)=a$; that is $\left(\operatorname{neut}\left(c^{2}\right) * x\right) * \operatorname{neut}\left(c^{2}\right)=\operatorname{neut}\left(c^{2}\right) *\left(\operatorname{neut}\left(c^{2}\right) *\right.$ $x)=\operatorname{neut}\left(c^{2}\right) * x$, for any $x \in\left\{\operatorname{anti}\left(c^{2}\right)\right\}$. Being neut $\left(d^{1}\right) * d=d$, neut $\left.\left(d^{1}\right) * d\right) * \operatorname{neut}\left(d^{1}\right)=d$, $\operatorname{neut}\left(d^{1}\right) *\left(\operatorname{neut}\left(d^{1}\right) * d\right)=d$, that is $\left(\operatorname{neut}\left(d^{1}\right) * x\right) * \operatorname{neut}\left(d^{1}\right)=\operatorname{neut}\left(d^{1}\right) *\left(\operatorname{neut}\left(d^{1}\right) * x\right)=$ neut $\left(d^{1}\right) * x$, for any $x \in\left\{\operatorname{anti}\left(d^{1}\right)\right\}$.
(7) Being neut $\left(\operatorname{neut}\left(c^{2}\right) * a\right) * \operatorname{anti}\left(\operatorname{neut}\left(c^{2}\right) * a\right)=a=c^{2}$; neut $\left(\operatorname{neut}\left(c^{2}\right) * b\right) * \operatorname{anti}\left(\operatorname{neut}\left(c^{2}\right) * b\right)=$ $a=c^{2} ; \operatorname{neut}\left(\right.$ neut $\left.\left(c^{2}\right) * c\right) * \operatorname{anti}\left(\right.$ neut $\left.\left(c^{2}\right) * c\right)=a=c^{2}$; that is neut $\left(\right.$ neut $\left.\left(c^{2}\right) * x\right) * \operatorname{anti}\left(\right.$ neut $\left(c^{2}\right) *$ $x)=c^{2}$, for any $x \in\left\{\operatorname{anti}\left(c^{2}\right)\right\}$. Being neut $\left(\right.$ neut $\left.\left(d^{1}\right) * d\right) * \operatorname{anti}\left(n e u t\left(d^{1}\right) * d\right)=d^{1}$, that is $\operatorname{neut}\left(\operatorname{neut}\left(d^{1}\right) * x\right) * \operatorname{anti}\left(\operatorname{neut}\left(d^{1}\right) * x\right)=d^{1}$, for any $x \in\left\{\operatorname{anti}\left(d^{1}\right)\right\}$.

Proposition 4. Let $(N, *)$ be a GAG-NET-Loop, then $\forall a, b \in N$, there are two positive integers $n$ and $m$ such that the following hold:
(1) $\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(b^{m}\right)=\operatorname{neut}\left(a^{n} * b^{m}\right)$.
(2) $\operatorname{anti}\left(a^{n}\right) * \operatorname{anti}\left(b^{m}\right) \in\left\{\operatorname{anti}\left(a^{n} * b^{m}\right)\right\}$.

Proof. Being $(N, *)$ be a GAG-NET-Loop, then for $a \in N$, there is a positive integer $n$, such that $a^{n}$ has the neutral element and opposite element, denoted by neut $\left(a^{n}\right)$ and $\operatorname{anti}\left(a^{n}\right)$, respectively. For $b \in N$, there is a positive integer $m$, such that $b^{m}$ has the neutral element and opposite element, denoted by neut $\left(b^{m}\right)$ and $\operatorname{anti}\left(b^{m}\right)$, respectively. Thus,

$$
\begin{aligned}
\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(b^{m}\right)\right) *\left(a^{n} * b^{m}\right) & =\left(\operatorname{neut}\left(a^{n}\right) * a^{n}\right) *\left(\operatorname{neut}\left(b^{m}\right) * b^{m}\right) \\
& =a^{n} * b^{m} .
\end{aligned}
$$

In the same way, we have $\left(a^{n} * b^{m}\right) *\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(b^{m}\right)\right)=a^{n} * b^{m}$.
That is,

$$
\left(a^{n} * b^{m}\right) *\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(b^{m}\right)\right)=\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(b^{m}\right)\right) *\left(a^{n} * b^{m}\right)=a^{n} * b^{m}
$$

Moreover, for any $\operatorname{anti}\left(a^{n}\right) \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$ and $\operatorname{anti}\left(b^{m}\right) \in\left\{\operatorname{anti}\left(b^{m}\right)\right\}$, we can get

$$
\begin{aligned}
\left(\operatorname{anti}\left(a^{n}\right) * \operatorname{anti}\left(b^{m}\right)\right) *\left(a^{n} * b^{m}\right) & =\left(\operatorname{anti}\left(a^{n}\right) * a^{n}\right) *\left(\operatorname{anti}\left(b^{m}\right) * b^{m}\right) \\
& =\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(b^{m}\right) .
\end{aligned}
$$

Similarly, we have $\left(a^{n} * b^{m}\right) *\left(\operatorname{anti}\left(a^{n}\right) * \operatorname{anti}\left(b^{m}\right)\right)=\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(b^{m}\right)$. That is:

$$
\left(a^{n} * b^{m}\right) *\left(\operatorname{anti}\left(a^{n}\right) * \operatorname{anti}\left(b^{m}\right)\right)=\left(\operatorname{anti}\left(a^{n}\right) * \operatorname{anti}\left(b^{m}\right)\right) *\left(a^{n} * b^{m}\right)=\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(b^{m}\right)
$$

Thus, we have

$$
\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(b^{m}\right) \in\left\{\operatorname{neut}\left(a^{n} * b^{m}\right)\right\} .
$$

From this, by Proposition 2, we get neut $\left(a^{n}\right) *$ neut $\left(b^{m}\right)=$ neut $\left(a^{n} * b^{m}\right)$. Therefore, we get anti $\left(a^{n}\right) *$ $\operatorname{anti}\left(b^{m}\right) \in\left\{\operatorname{anti}\left(a^{n} * b^{m}\right)\right\}$.

Example 9. Apply the $(S, *)$ in Example 8, since neut $(a)=a,\{\operatorname{anti}(a)\}=\{a, b, c\}$, neut $(d)=$ a, anti $(d)=d$ and $b^{2}=a, c^{2}=a$, so $(S, *)$ is a GAG-NET-Loop, we can get:
(1) Being neut $\left(c^{2}\right) * \operatorname{neut}\left(d^{1}\right)=a$, neut $\left(c^{2} * d^{1}\right)=a$, that is neut $\left(c^{2}\right) * \operatorname{neut}\left(d^{1}\right)=\operatorname{neut}\left(c^{2} * d^{1}\right)$.
(2) Being $a * d=b * d=c * d=d$, that is $\operatorname{anti}\left(c^{2}\right) * \operatorname{anti}\left(d^{1}\right) \in\left\{\operatorname{anti}\left(c^{2} * d^{1}\right)\right\}$

Theorem 7. Let $(N, *)$ be a GAG-NET-Loop. Then, $N$ is a quasi regular AG-groupoid.
Proof. For any $a$ in $N$, by Definition 11 we have $\left(a^{n} * \operatorname{anti}\left(a^{n}\right)\right) * a^{n}=\operatorname{neut}\left(a^{n}\right) * a^{n}=a^{n}$. From this and Definition 4, we know that $N$ is a quasi regular AG-groupoid.

The following example shows that a quasi regular AG-groupoid may not be a GAG-NET-loop.
Example 10. Apply the $(S, *)$ in Example 1, Being $1=(1 * 3) * 1,2=(2 * 4) * 2,3=(3 * 1) * 3,4=$ $(4 * 2) * 4$, From Definition 4, S is a quasi regular AG-groupoid. However, it is not a GAG-NET-Loop.

Theorem 8. Let $(N, *)$ be a GAG-NET-Loop. Then, $N$ is a quasi fully regular AG-groupoid.
Proof. Suppose $a \in N$ and ( $a, \operatorname{neut}\left(a^{n}\right)$, anti $\left.\left(a^{n}\right)\right)$ is a generalized neutrosophic extended triplet with degree $n$, then there exists $m \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}, a^{n} * m=m * a^{n}=\operatorname{neut}\left(a^{n}\right)$. Denote $p=m * \operatorname{neut}\left(a^{n}\right), q=$ $\operatorname{neut}\left(a^{n}\right) ; r=m, s=\operatorname{neut}\left(a^{n}\right) ; t=m, u=\operatorname{neut}\left(a^{n}\right) ; v=m ; w=m * \operatorname{neut}\left(a^{n}\right) ; x=m, y=\operatorname{neut}\left(a^{n}\right)$, then

$$
\begin{aligned}
&\left(p *\left(a^{n}\right)^{2}\right) * q=\left(\left(m * \text { neut }\left(a^{n}\right)\right) *\left(a^{n}\right)^{2}\right) * \text { neut }\left(a^{n}\right) \\
&=\left(\left(\left(a^{n}\right)^{2} * \operatorname{neut}\left(a^{n}\right)\right) * m\right) * \text { neut }\left(a^{n}\right) \quad(\text { by the left invertive law }) \\
&=\left(\left(\left(a^{n} * a^{n}\right) * \operatorname{neut}\left(a^{n}\right)\right) * m\right) * \text { neut }\left(a^{n}\right) \\
&=\left(\left(\left(\text { neut }\left(a^{n}\right) * a^{n}\right) * a^{n}\right) * m\right) * \text { neut }\left(a^{n}\right) \quad(\text { by the left invertive law }) \\
&=\left(\left(a^{n} * a^{n}\right) * m\right) * \operatorname{neut}\left(a^{n}\right) \\
&=\left(\left(m * a^{n}\right) * a^{n}\right) * \operatorname{neut}\left(a^{n}\right) \quad(\text { by the left invertive law }) \\
&=\left(\text { neut }\left(a^{n}\right) * a^{n}\right) * \operatorname{neut}\left(a^{n}\right) \\
&=a^{n} * \text { neut }\left(a^{n}\right)=a^{n}, \\
&\left(r * a^{n}\right) *\left(a^{n} * s\right)=\left(m * a^{n}\right) *\left(a^{n} * \text { neut }\left(a^{n}\right)\right)=\text { neut }\left(a^{n}\right) * a^{n}=a^{n}, \\
&\left(a^{n} * t\right) *\left(a^{n} * u\right)=\left(a^{n} * m\right) *\left(a^{n} * \text { neut }\left(a^{n}\right)\right)=\text { neut }\left(a^{n}\right) * a^{n}=a^{n}, \\
&\left(a^{n} * a^{n}\right) * v=\left(a^{n} * a^{n}\right) * m=\left(m * a^{n}\right) * a^{n}=\text { neut }\left(a^{n}\right) * a^{n}=a^{n}, \\
& w *\left(a^{n} * a^{n}\right)=\left(m * \text { neut }\left(a^{n}\right)\right) *\left(a^{n} * a^{n}\right) \\
&=\left(m * a^{n}\right) *\left(\text { neut }\left(a^{n}\right) * a^{n}\right) \quad(\text { by the medial law }) \\
&=\left(m * a^{n}\right) * a^{n} \\
&=\operatorname{neut}\left(a^{n}\right) * a^{n}=a^{n},
\end{aligned} \quad \begin{aligned}
\left(x * a^{n}\right) *\left(y * a^{n}\right)=\left(m * a^{n}\right) *\left(n e u t\left(a^{n}\right) * a^{n}\right)=\text { neut }\left(a^{n}\right) * a^{n}=a^{n} .
\end{aligned}
$$

Moreover, from Proposition 4, we get:

$$
\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(b^{m}\right)=\operatorname{neut}\left(a^{n} * b^{m}\right), \operatorname{anti}\left(a^{n}\right) * \operatorname{anti}\left(b^{m}\right) \in\left\{\operatorname{anti}\left(a^{n} * b^{m}\right)\right\} .
$$

If $b^{m}=a^{n}$, we have $\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(a^{n}\right)=\operatorname{neut}\left(a^{n} * a^{n}\right)$, $\operatorname{anti}\left(a^{n}\right) * \operatorname{anti}\left(a^{n}\right) \in\left\{\operatorname{anti}\left(a^{n} * a^{n}\right)\right\}$, there exists $k \in\left\{\operatorname{anti}\left(a^{n} * a^{n}\right)\right\}$. Denote $z=k * m$, then

$$
\begin{aligned}
\left(\left(a^{n}\right)^{2} * z\right) *\left(a^{n}\right)^{2} & =\left(\left(a^{n} * a^{n}\right) * z\right) *\left(a^{n}\right)^{2} \\
& =\left(\left(z * a^{n}\right) * a^{n}\right) *\left(a^{n}\right)^{2} \quad \text { (applying the left invertive law) } \\
& =\left(\left(a^{n}\right)^{2} * a^{n}\right) *\left(z * a^{n}\right) \quad(\text { applying the left invertive law }) \\
& =\left(\left(a^{n}\right)^{2} * a^{n}\right) *\left((k * m) * a^{n}\right) \\
& =\left(\left(a^{n}\right)^{2} * a^{n}\right) *\left(\left(a^{n} * m\right) * k\right) \quad(\text { by the left invertive law }) \\
& =\left(\left(a^{n}\right)^{2} * a^{n}\right) *\left(\text { neut }\left(a^{n}\right) * k\right) \quad\left(\text { by } m \in\left\{\text { anti }\left(a^{n}\right)\right\}\right) \\
& =\left(\left(a^{n} * a^{n}\right) *\left(\text { neut }\left(a^{n}\right) * a^{n}\right)\right) *\left(\text { neut }\left(a^{n}\right) * k\right) \\
& \left.=\left(\left(a^{n} * \operatorname{neut}\left(a^{n}\right)\right) *\left(a^{n} * a^{n}\right)\right) *\left(\text { neut }\left(a^{n}\right) * k\right) \quad \text { (applying the medial law }\right) \\
& =\left(a^{n} *\left(a^{n}\right)^{2}\right) *\left(\text { neut }\left(a^{n}\right) * k\right) \\
& =\left(a^{n} * \operatorname{neut}\left(a^{n}\right)\right) *\left(\left(a^{n}\right)^{2} * k\right) \quad(\text { applying the medial law }) \\
& =a^{n} * \operatorname{neut}\left(a^{n} * a^{n}\right) \quad\left(b y \text { the definition of } k \in\left\{\text { anti }\left(a^{n} * a^{n}\right)\right\}\right) \\
& =a^{n} *\left(\text { neut }\left(a^{n}\right) * \text { neut }\left(a^{n}\right)\right) \\
& =a^{n} * \operatorname{neut}\left(a^{n}\right) \quad \quad(\text { by Proposition } 2(2)) \\
& =a^{n} .
\end{aligned}
$$

Therefore, combining above results, by Definition 5 , we know that $N$ is a quasi fully regular AG-groupoid.

The following example shows that a quasi fully regular AG-groupoid may not be a GAG-NET-loop.

Example 11. Applying the $(S, *)$ in Example 1, when $a=1, p=1, q=3, r=4, s=3, t=2, u=3, v=$ $2, w=2, x=4, y=2, z=3$, we have $a^{2}=2$, and

$$
\begin{aligned}
1 & =(1 * 2) * 3=(4 * 1) *(1 * 3)=(1 * 2) *(1 * 3) \\
& =(1 * 1) * 2=2 *(1 * 1)=(4 * 1) *(2 * 1) \\
& =(2 * 3) * 2
\end{aligned}
$$

When $a=4, p=1, q=3, r=4, s=4, t=3, u=2, v=3, w=3, x=4, y=4, z=2$, we have $a^{2}=3$, and

$$
\begin{aligned}
4 & =(1 * 3) * 3=(4 * 4) *(4 * 4)=(4 * 3) *(4 * 2) \\
& =(4 * 4) * 3=3 *(4 * 4)=(4 * 4) *(4 * 4) \\
& =(3 * 2) * 3
\end{aligned}
$$

Being $2^{2}=1,3^{3}=1$, from Definition 5, $S$ is a quasi fully regular $A G$-groupoid. However, it is not a GAG-NET-Loop.

Definition 13. An AG-groupoid $(S, *)$ is called a quasi strong inverse $A G$-groupoid, if the following conditions are satisfied: for any $a \in S$, there exists a positive integer $n, a^{n} \in S$, and a unary operation $a^{n} \rightarrow\left(a^{n}\right)^{-1}$ on $S$ such that

$$
\left(\left(a^{n}\right)^{-1}\right)^{-1}=a^{n}, \quad\left(a^{n} *\left(a^{n}\right)^{-1}\right) * a^{n}=a^{n} *\left(a^{n} *\left(a^{n}\right)^{-1}\right)=a^{n}, a^{n} *\left(a^{n}\right)^{-1}=\left(a^{n}\right)^{-1} * a^{n} .
$$

Theorem 9. Let $(N, *)$ be a groupoid. Then, $N$ is a GAG-NET-Loop if and only if it is a quasi strong inverse AG-groupoid.

Proof. Necessity: Suppose $N$ is a GAG-NET-Loop, from Definition 12, for each $a \in N$, there exists a generalized neutrosophic extended triplet with degree n denoted by $\left(a, \operatorname{neut}\left(a^{n}\right)\right.$, $\operatorname{anti}\left(a^{n}\right)$ ). Set

$$
\left(a^{n}\right)^{-1}=\operatorname{neut}\left(a^{n}\right) * \operatorname{anti}\left(a^{n}\right)
$$

by Proposition 3(2), neut $\left(a^{n}\right) * \operatorname{anti}\left(a^{n}\right)$ is unique, so $\left(a^{n}\right)^{-1}$ is unique. By Proposition 3(7), we have

$$
\left(\left(a^{n}\right)^{-1}\right)^{-1}=\operatorname{neut}\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{anti}\left(a^{n}\right)\right) * \operatorname{anti}\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{anti}\left(a^{n}\right)\right)=a^{n} .
$$

Being
$\left(a^{n}\right)^{-1} * a^{n}=\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{anti}\left(a^{n}\right)\right) * a^{n}=\left(a^{n} * \operatorname{anti}\left(a^{n}\right)\right) * \operatorname{neut}\left(a^{n}\right)=\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(a^{n}\right)=\operatorname{neut}\left(a^{n}\right)$,

$$
\begin{aligned}
a^{n} *\left(a^{n}\right)^{-1} & =a^{n} *\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{anti}\left(a^{n}\right)\right) \\
& =\left(\operatorname{neut}\left(a^{n}\right) * a^{n}\right) *\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{anti}\left(a^{n}\right)\right) \\
& =\left(\operatorname{neut}\left(a^{n}\right) * \operatorname{neut}\left(a^{n}\right)\right) *\left(a^{n} * \operatorname{anti}\left(a^{n}\right)\right) \\
& =\operatorname{neut}\left(a^{n}\right),
\end{aligned}
$$

we have

$$
\begin{aligned}
\left(a^{n}\right)^{-1} * a^{n} & =a^{n} *\left(a^{n}\right)^{-1} \\
\left(a^{n} *\left(a^{n}\right)^{-1}\right) * a^{n} & =\operatorname{neut}\left(a^{n}\right) * a^{n}=a^{n}
\end{aligned}
$$

$$
\begin{gathered}
a^{n} *\left(a^{n} *\left(a^{n}\right)^{-1}\right)=a^{n} * \operatorname{neut}\left(a^{n}\right)=a^{n}, \\
\left(a^{n} *\left(a^{n}\right)^{-1}\right) * a^{n}=a^{n} *\left(a^{n} *\left(a^{n}\right)^{-1}\right)=a^{n} .
\end{gathered}
$$

From Definition $13, N$ is a quasi strong inverse AG-groupoid.
Sufficiency: If $N$ is a quasi strong inverse AG-groupoid, and $\left(a^{n}\right)^{-1} \in N$, such that $a^{n} *\left(a^{n}\right)^{-1}=$ $\left(a^{n}\right)^{-1} * a^{n}$ and $\left(a^{n} *\left(a^{n}\right)^{-1}\right) * a^{n}=a^{n} *\left(a^{n} *\left(a^{n}\right)^{-1}\right)=a^{n}$. Set

$$
\operatorname{neut}\left(a^{n}\right)=a^{n} *\left(a^{n}\right)^{-1}
$$

then $\operatorname{neut}\left(a^{n}\right) * a^{n}=\left(a^{n} *\left(a^{n}\right)^{-1}\right) * a^{n}=a^{n} *\left(a^{n} *\left(a^{n}\right)^{-1}\right)=a^{n} * \operatorname{neut}\left(a^{n}\right)=a^{n}$,

$$
a^{n} *\left(a^{n}\right)^{-1}=\left(a^{n}\right)^{-1} * a^{n}=\operatorname{neut}\left(a^{n}\right)
$$

From Definition 12, we have that $N$ is a GAG-NET-Loop and $\left(a^{n}\right)^{-1} \in\left\{\operatorname{anti}\left(a^{n}\right)\right\}$.
Example 12. Applying $(S, *)$ in Example 8, we know that it is a GAG-NET-Loop. We will show that it is a quasi strong inverse $A G$-groupoid in the following.

For $d$, there exists an inverse element $d^{-1}=d$, such that $\left(d^{-1}\right)^{-1}=d,\left(d * d^{-1}\right) * d=d *\left(d * d^{-1}\right)=$ $d, d * d^{-1}=d^{-1} * d=a$, so $d$ is quasi strong inverse. a is quasi strong inverse for the same reason. Moreover, being $b^{2}=a, c^{2}=a, b$ and $c$ are quasi strong inverse, thus $(S, *)$ is a quasi strong inverse AG-groupoid by Definition 13.

Definition 14. Let $(N, *)$ be a GAG-NET-Loop. $N$ is called a weak commutative $G A G-N E T$-Loop if $\forall a, b \in N$, there exist a generalized neutrosophic extended triplet with degree $n$ (denoted by $\left(a, n e u t\left(a^{n}\right)\right.$, anti( $\left.\left.a^{n}\right)\right)$ ) and a generalized neutrosophic extended triplet with degree $m$ (denoted by $\left(b, n e u t\left(b^{m}\right)\right.$, anti $\left.\left(b^{m}\right)\right)$ ), $n, m \in Z^{+}$, $a^{n} * \operatorname{neut}\left(b^{m}\right)=\operatorname{neut}\left(b^{m}\right) * a^{n}$.

Example 13. Let $S=\{1,2,3,4,5,6,7\}$, an operation $*$ on $S$ is defined as in Table 8. Since $(1,1,1),(2,2,2)$ and $(6,6,6)$ are neutrosophic extended triplets, but $3,4,5,7$ do not have the neutral element and opposite element, thus $S$ is not an AG-NET-Loop. Moreover $3^{2}=1,4^{2}=1,5^{2}=2,7^{2}=6$ have the neutral element and opposite element, so $(S, *)$ is a GAG-NET-Loop. It is not a commutative GAG-NET-Loop being $3 * 1 \neq 1 * 3$. We can show that it is a weak commutative GAG-NET-Loop.

For $1,2,3,4,5,6$ and 7 , there exist positive integers $1,1,2,2,2,1$ and 2 , respectively, thus $S^{\prime}=$ $\left\{1^{1}, 2^{1}, 3^{2}, 4^{2}, 5^{2}, 6^{1}, 7^{2}\right\}=\{1,2,6\}$ being $3^{2}=1,4^{2}=1,5^{2}=2,7^{2}=6$. We know that neut $(1)=$ $1, \operatorname{neut}(2)=2, \operatorname{neut}(6)=6$, thus $\{$ neut $(1)$,neut $(2)$, neut $(6)\} \subseteq S^{\prime}$. In Table 8 , we can get the sub algebra system $\left(S^{\prime}, *\right)$ of $(S, *)$ as in Table 9, and $\left(S^{\prime}, *\right)$ is commutative. Thus, $(S, *)$ is a weak commutative GAG-NET-Loop.

Table 8. The operation table of Example 13.

| :---: | :---: | :---: | :---: |
| 1 | 1 | 2 | 6 |
| 2 | 2 | 2 | 2 |
| 6 | 6 | 2 | 6 |

Example 14. Let $S=\{1,2,3,4\}$, an operation $*$ on $S$ is defined as in Table 10. Being neut $(1) * 2=4 \neq 3=$ $2 *$ neut (1), $S$ is not a weak commutative GAG-NET-Loop. Moreover, it is not a commutative AG-NET-Loop.

Table 10. The operation table of Example 14.

| $*$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 4 | 2 | 3 |
| 2 | 3 | 2 | 4 | 1 |
| 3 | 4 | 1 | 3 | 2 |
| 4 | 2 | 3 | 1 | 4 |

Proposition 5. Let $(N, *)$ be a GAG-NET-Loop. Then, $(N, *)$ is a weak commutative GAG-NET-Loop if and only if $N$ satisfies the following conditions: $\forall a, b \in N$, there exist a generalized neutrosophic extended triplet with degree $n\left(\right.$ denoted by $\left(a, n e u t\left(a^{n}\right)\right.$, anti $\left.\left(a^{n}\right)\right)$ ) and a generalized neutrosophic extended triplet with degree $m$ (denoted by $\left(b, \operatorname{neut}\left(b^{m}\right)\right.$, anti $\left.\left(b^{m}\right)\right)$ ), $n, m \in Z^{+}, a^{n} * b^{m}=b^{m} * a^{n}$.

Proof. Necessity: If $(N, *)$ is a weak commutative GAG-NET-Loop, then there are two positive integers $n, m$, such that $a^{n}$ and $b^{m}$ have the neutral element and opposite element. Thus, from Definition 14, $\forall a, b \in N$, we have

$$
\begin{aligned}
a^{n} * b^{m} & =\left(\operatorname{neut}\left(a^{n}\right) * a^{n}\right) *\left(b^{m} * \operatorname{neut}\left(b^{m}\right)\right) \\
& =\left(\operatorname{neut}\left(a^{n}\right) * b^{m}\right) *\left(a^{n} * \operatorname{neut}\left(b^{m}\right)\right) \\
& =\left(b^{m} * \operatorname{neut}\left(a^{n}\right)\right) *\left(\operatorname{neut}\left(b^{m}\right) * a^{n}\right) \\
& =\left(b^{m} * \operatorname{neut}\left(b^{m}\right)\right) *\left(\operatorname{neut}\left(a^{n}\right) * a^{n}\right) \\
& =b^{m} * a^{n} .
\end{aligned}
$$

Sufficiency: If $(N, *)$ is a GAG-NET-Loop, then for $a \in N$, there is a positive integer $n$, such that $a^{n}$ has the neutral element and opposite element, denoted by neut ( $a^{n}$ ) and $\operatorname{anti}\left(a^{n}\right)$, respectively. For $b \in N$, there is a positive integer $m$, such that $b^{m}$ has the neutral element and opposite element, denoted by neut $\left(b^{m}\right)$ and $\operatorname{anti}\left(b^{m}\right)$, respectively. Suppose that $(N, *)$ satisfies the conditions $a^{n} * b^{m}=$ $b^{m} * a^{n}$, From Proposition 2, we have neut $\left(b^{m}\right)$ exists neutral element and opposite element. We get $a^{n} * \operatorname{neut}\left(b^{m}\right)=\operatorname{neut}\left(b^{m}\right) * a^{n}$. From Definition 14, we know that $(N, *)$ is a weak commutative GAG-NET-Loop.

Definition 15. A GAG-NET-Loop $(S, *)$ is called a quasi Clifford $A G$-groupoid, if it is a quasi strong inverse AG-groupoid and for any $a, b \in S$, there are two positive integers $n, m$ such that

$$
a^{n} *\left(b^{m} *\left(b^{m}\right)^{-1}\right)=\left(b^{m} *\left(b^{m}\right)^{-1}\right) * a^{n}
$$

Theorem 10. Let $(N, *)$ be a groupoid. Then, $N$ is a weak commutative GAG-NET-Loop if and only if it is a quasi Clifford AG-groupoid.

Proof. Necessity: Suppose that $N$ is a weak commutative GAG-NET-Loop. By Theorem 9, we know that $N$ is a quasi strong inverse AG-groupoid, then $\forall a, b \in N$ there are two positive integers $n, m$, such that $a^{n}$ and $b^{m}$ have the neutral element and opposite element. Set

$$
\left(a^{n}\right)^{-1}=\operatorname{neut}\left(a^{n}\right) * \operatorname{anti}\left(a^{n}\right)
$$

For any $a, b \in N$, we have

$$
a^{n} *\left(b^{m} *\left(b^{m}\right)^{-1}\right)=a^{n} * \operatorname{neut}\left(b^{m}\right)=\operatorname{neut}\left(b^{m}\right) * a^{n}=\left(b^{m} *\left(b^{m}\right)^{-1}\right) * a^{n}
$$

From Definition 15, we know that $N$ is a quasi Clifford AG-groupoid.
Sufficiency: Assume that $N$ is a quasi Clifford AG-groupoid, from Definition 15, it is a quasi strong inverse AG-groupoid. By Theorem 9, we know that $N$ is a GAG-NET-Loop. Then, $\forall a, b \in N$ there are two positive integers $n, m$, such that $a^{n}$ and $b^{m}$ have the neutral element and opposite element, $\left(a^{n}\right)^{-1} \in N,\left(b^{m}\right)^{-1} \in N$. Set

$$
\operatorname{neut}\left(a^{n}\right)=a^{n} *\left(a^{n}\right)^{-1}, \operatorname{neut}\left(b^{m}\right)=b^{m} *\left(b^{m}\right)^{-1}
$$

From Definition 15, being $a^{n} *\left(b^{m} *\left(b^{m}\right)^{-1}\right)=\left(b^{m} *\left(b^{m}\right)^{-1}\right) * a^{n}$, we have $a^{n} * \operatorname{neut}\left(b^{m}\right)=$ $\operatorname{neut}\left(b^{m}\right) * a^{n}$. We can get that $N$ is a weak commutative GAG-NET-Loop by Definition 14 .

Example 15. Let $S=\{1,2,3,4,5,6,7,8\}$, an operation $*$ on $S$ is defined as in Table 11. It is a weak commutative GAG-NET-Loop. We show that it is a quasi Clifford AG-groupoid. From Theorem 9, we can see that $(S, *)$ is a quasi strong inverse $A G$-groupoid. We just show for any $x, y \in S$, there are two positive integers $n$ and $m$ such that $x^{n} *\left(y^{m} *\left(y^{m}\right)^{-1}\right)=\left(y^{m} *\left(y^{m}\right)^{-1}\right) * x^{n}$.

In Example 15, 1, 2, 3, 4, 5, 6, 7 and 8, there exist positive integers 1, 1,2,2,2,1,2 and 2, respectively, and set $1^{-1}=1,2^{-1}=2,\left(3^{2}\right)^{-1}=1,\left(4^{2}\right)^{-1}=1,\left(5^{2}\right)^{-1}=2,6^{-1}=6,\left(7^{2}\right)^{-1}=6,\left(8^{2}\right)^{-1}=6$. For any $x, y \in\left\{1^{1}, 2^{1}, 3^{2}, 4^{2}, 5^{2}, 6^{1}, 7^{2}, 8^{2}\right\}$, without losing generality, let $x=1, y=2$, we can get $1^{1} *\left(2^{1} *\left(2^{1}\right)^{-1}\right)=$ $\left(2^{1} *\left(2^{1}\right)^{-1}\right) * 1^{1}=2$. We can verify other cases, thus $(S, *)$ is a quasi Clifford AG-groupoid.

Table 11. The operation table of Example 15.

| $\boldsymbol{*}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 |
| 3 | 4 | 2 | 1 | 3 | 5 | 6 | 7 | 8 |
| 4 | 3 | 2 | 4 | 1 | 5 | 6 | 7 | 8 |
| 5 | 5 | 2 | 5 | 5 | 2 | 2 | 2 | 2 |
| 6 | 6 | 2 | 6 | 6 | 2 | 6 | 6 | 6 |
| 7 | 7 | 2 | 7 | 7 | 2 | 6 | 6 | 6 |
| 8 | 8 | 2 | 8 | 8 | 2 | 6 | 6 | 6 |

Example 16. Let $S=\{1,2,3,4,5\}$, an operation $*$ on $S$ is defined as in Table 12. it is not a weak commutative GAG-NET-Loop. We show that there exist $x, y \in S$, for any two positive integers $n$ and $m$ such that $x^{n} *\left(y^{m} *\right.$ $\left.\left(y^{m}\right)^{-1}\right) \neq\left(y^{m} *\left(y^{m}\right)^{-1}\right) * x^{n}$.

In Example 16, for any $n, m \in Z^{+}, 1^{n}=1,2^{m}=2$ and $\left(1^{n}\right)^{-1}=1,\left(2^{m}\right)^{-1}=2$, but $1^{n} *\left(2^{m} *\right.$ $\left.\left(2^{m}\right)^{-1}\right)=4 \neq 3=\left(2^{m} *\left(2^{m}\right)^{-1}\right) * 1^{n}$. That is, for $1,2 \in S$, there are not two positive integers $n, m$ such that $1^{n} *\left(2^{m} *\left(2^{m}\right)^{-1}\right)=\left(2^{m} *\left(2^{m}\right)^{-1}\right) * 1^{n}$. Thus, $(S, *)$ is not a quasi Clifford AG-groupoid.

Table 12. The operation table of Example 16.

| $*$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 1 | 4 | 2 | 3 | 1 |
| 2 | 3 | 2 | 4 | 1 | 3 |
| 3 | 4 | 1 | 3 | 2 | 4 |
| 4 | 2 | 3 | 1 | 4 | 2 |
| 5 | 1 | 4 | 2 | 3 | 5 |

## 5. Conclusions

We thoroughly study the GAG-NET-Loop from the perspective of the AG-groupoid theory and obtained some important results. Figures 1 and 2 give the relations of the GAG-NET-Loop and other algebraic structures.

Figure 1. The relations of GAG-NET-Loop and other algebraic structures.

Figure 2. The relations of GAG-NET-Loop and other AG-groupoids.
As can be seen in Figure 1, we prove that the AG-NET-Loop is equal to the strong inverse AG-groupoid, the GAG-NET-Loop is equal to the quasi strong inverse AG-groupoid, and the weak commutative GAG-NET-Loop is equal to the quasi Clifford AG-groupoid.

As can be seen in Figure 2, we prove that a GAG-NET-loop is a quasi regular AG-groupoid, but a quasi regular AG-groupoid may not be a GAG-NET-loop; a GAG-NET-loop is a quasi fully regular AG-groupoid, but a quasi fully regular AG-groupoid may not be a GAG-NET-loop.

Figure 3 can be used to further express the relationships among GAG-NET-Loop and some algebraic systems. Here, as shown in Example 2, A represents a commutative AG-NET-Loop; as shown in Example 15, B represents a weak commutative GAG-NET-Loop, but it is not an AG-NET-Loop; as is shown in Example 14, C represents a non-commutative AG-NET-Loop; D represents a GAG-NET- Loop, but it is neither an AG-NET-Loop nor a weak commutative GAG-NET-Loop; as shown in Example 10, E represents a quasi regular AG-groupoid, but it is not a GAG-NET-Loop; and as shown in Example 11, F represents a quasi fully regular AG-groupoid, but it is not a GAG-NET-Loop. A+B represents a weak commutative GAG-NET-Loop, $\mathrm{A}+\mathrm{C}$ represents an $\mathrm{AG}-\mathrm{NET}$-Loop, $\mathrm{A}+\mathrm{B}+\mathrm{C}+\mathrm{D}$ represents a

GAG-NET-Loop, $\mathrm{A}+\mathrm{B}+\mathrm{C}+\mathrm{D}+\mathrm{E}$ represents a quasi regular AG -groupoid, and $\mathrm{A}+\mathrm{B}+\mathrm{C}+\mathrm{D}+\mathrm{F}$ represents a quasi fully regular AG-groupoid.

Figure 3. The relationships among some algebraic systems and GAG-NET-Loop.
All these results are interesting for the exploration of the structure characterization of GAG-NET-Loop. As the next research topics, we want to find some special GAG-NET-Loops which can be decomposed into some smaller GAG-NET-Loops, and explore the relationship between these special GAG-NET-Loops and the related AG-groupoids.
