ABSTRACT

In order to solve the complex decision-making problems, there are many approaches and systems based on the fuzzy theory were proposed. In 1998, Smarandache [10] introduced the concept of single-valued neutrosophic set as a complete development of fuzzy theory. In this paper, we research on the distance measure between single-valued neutrosophic sets based on the H-max measure of Ngan et al. [8]. The proposed measure is also a distance measure between picture fuzzy sets which was introduced by Cuong in 2013[15]. Based on the proposed measure, an Adaptive Neuro Picture Fuzzy Inference System (ANPFIS) is built and applied to the decision making for the link states in interconnection networks. In experimental evaluation on the real datasets taken from the UPV (Universitat Politècnica de València) university, the performance of the proposed model is better than that of the related fuzzy methods.

1. Introduction

The fuzzy theory was introduced the first time in 1965 by Zadeh [1]. A fuzzy set is determined by a membership function limited to [0, 1]. Until now, there is a giant research construction of fuzzy theory as well as its application. The fuzzy set is used in pattern recognition, artificial intelligent, decision making, or

DOI: 10.22105/jfea.2020.249183.1009
data mining [2, 3], and so on. Besides that, the expansion of fuzzy theory is also an interesting topic. The interval-valued fuzzy set [4], the type-2 fuzzy set [5], and the intuitionistic fuzzy set [6] are all developed from the fuzzy set. They replaced the value type or added the other evaluation to the fuzzy set in order to overcome the inadequate simple approach of this traditional fuzzy set. Such as in 1986, the intuitionistic fuzzy set of Atanassov [6] builds up the concept of the non-membership degree. This supplement gives more accurate results in pattern recognition, medical diagnosis and decision making [7-9], and so on. In 1998, Smarandache [10] introduced neutrosophic set to generalize intuitionistic fuzzy set by three independent components. Until today, many subclasses of neutrosophic sets were studied such as complex neutrosophic sets [11, 12]. As a particular case of standard neutrosophic sets [13, 14], the picture fuzzy set introduced in 2013 by Cuong [15], considered as a complete development of the fuzzy theory, allows an element to belong to it with three corresponding degrees where all of these degrees and their sum are limited to [0, 1]. Concerning extended fuzzy set, some recent publications may be mentioned here as in [16-20].

As one of the important pieces of set theory, distance measure between the sets is a tool for evaluating different or similar levels between them. Some literature on the application of intuitionistic fuzzy measure from 2012 to present can be found in [7, 21-23]. In 2018, Wei introduced the generalized Dice similarity measures for picture fuzzy sets [17]. However, the definition of Wei is without considering the condition related to order relation on picture fuzzy sets. In a decision-making model, a distance measure can be used to compare the similarities between the sets of attributes of the samples and that of the input, such as in predicting dental diseases from images [24]. In this paper, we define the concept of the single-valued neutrosophic distance measure, picture fuzzy distance measure, and represent the specific measure formula. We prove the characteristics of this formula as well as the relation among it and some of the other operators of picture fuzzy sets. The proposed distance measure is inspired by the H-max distance measure of intuitionistic fuzzy sets [8]. Hence, it inherits the advantage of the cross-evaluation in the H-max and moreover it has the completeness of picture fuzzy environment.

The decision-making problems appear in most areas aiming to provide the optimal solution. Saving interconnection network power is always interested, researched and becoming more and more urgent in the current technological era. In 2010, Alonso et al. introduced the power saving mechanism in regular interconnection network [25]. This decision-making model dynamically increases or reduces the number of links based on a thresholds policy. In 2015, they continue to study power consumption control in fat-tree interconnection networks based on the static and dynamic thresholds policies [26]. In general, these threshold policies are rough and hard because they are without any fuzzy approaches, parameter learning and optimizing processes. In 2017, Phan et al. [27] proposed a new method in power consumption estimation of network-on-chip based on fuzzy logic. However, this fuzzy logic system based on Sugeno model [27] is too rudimentary and the parameters here are chosen according to the authors’ quantification.

In this paper, aiming to replace the above threshold policy, an Adaptive Neuro Picture Fuzzy Inference System (ANPFIS) based on picture fuzzy distance measure is proposed to make the decisions for the link states in interconnection networks. ANPFIS is a modification and combination between Adaptive Neuro Fuzzy Inference System (ANFIS) [28-30], picture fuzzy set, and picture fuzzy distance measure. Hence, ANPFIS operates based on the picture fuzzification and defuzzification processes, the picture fuzzy operators [18] and distance measure, and the learning capability for automatic picture fuzzy rule generation and
parameter optimization. In order to evaluate performance, we tested the ANPFIS method on the real datasets of the network traffic history taken from the UPV (Universitat Politècnica de València) university with related methods. The result is that ANPFIS is the most effective algorithm.

The rest of the paper is organized as follows. Section 2 provides some fundamental concepts of the fuzzy, intuitionistic fuzzy, single-valued neutrosophic, and picture fuzzy theories. Section 3 proposes the distance measure of single-valued neutrosophic sets and points out its important properties. Section 4 shows the new decision-making method named Adaptive Neuro Picture Fuzzy Inference System (ANPFIS) and an application of ANPFIS to controlling network power consumption. Section 5 shows the experimental results of ANPFIS and the related methods on real-world datasets. Finally, conclusion is given in Section 6.

2. Preliminary

In this part, some concepts of the theories of fuzzy sets, intuitionistic fuzzy sets, single-valued neutrosophic sets, and picture fuzzy sets are showed.

Let $X$ be a space of points.

**Definition 1.** [1] A fuzzy set (FS) $A$ in $X$,

$$A = \{(x : \mu_A(x)) | x \in X\},$$

is characterized by a membership function, $\mu_A$, with a range in $[0,1]$.

**Definition 2.** [6] A intuitionistic fuzzy set (IFS) $A$ in $X$,

$$A = \{(x : \mu_A(x), \nu_A(x)) | x \in X\},$$

is characterized by a membership function $\mu_A$ and a non-membership function $\nu_A$ with a range in $[0,1]$ such that $0 \leq \mu_A + \nu_A \leq 1$.

**Definition 3.** [31] A Single-Valued Neutrosophic Set (SVNS) $A$ in $X$,

$$A = \{(x : T_A(x), I_A(x), F_A(x)) | x \in X\},$$

is characterized by a truth-membership function $T_A$, an indeterminacy-membership function $I_A$, and a false-nonmembership function $F_A$ with a range in $[0,1]$ such that $0 \leq T_A + I_A + F_A \leq 3$.

**Definition 4.** [15] A Picture Fuzzy Set (PFS) $A$ in $X$,

$$A = \{(x : \mu_A(x), \eta_A(x), \nu_A(x)) | x \in X\},$$

(4)
is characterized by a positive membership function \( \mu_{\delta} \), a neutral function \( \eta_{\delta} \), and a negative membership function \( \nu_{\delta} \) with a range in \([0,1]\) such that \( 0 \leq \mu_{\delta} + \eta_{\delta} + \nu_{\delta} \leq 1 \).

We denote that \( \text{SVNS}(\chi) \) is the set of all SVNSs in \( \chi \) and \( \text{PFS}(\chi) \) is the set of all PFSs in \( \chi \). We consider the sets \( \mathcal{N}^{-}\) and \( \mathcal{P}^{-} \) defined by

\[
\mathcal{N}^{-} = \left\{ x = (x_1, x_2, x_3) \mid 0 \leq x_1, x_2, x_3 \leq 1 \right\},
\]

\[
\mathcal{P}^{-} = \left\{ x = (x_1, x_2, x_3) \mid 0 \leq x_1, x_2, x_3, x_1 + x_2 + x_3 \leq 1 \right\}.
\]

**Definition 5.** The orders on \( \mathcal{N}^{-} \) and \( \mathcal{P}^{-} \) are defined as follows

- \( x \leq y \iff (x_1 < y_1, x_2 \geq y_2) \vee (x_1 = y_1, x_3 > y_3) \vee (x_1 = y_1, x_3 = y_3, x_2 \leq y_2), \forall x, y \in \mathcal{P}^{-}, \) \[19\].
- \( x \ll y \iff x_1 \leq y_1, x_2 < y_2, x_3 \geq y_3, \forall x, y \in \mathcal{N}^{-}. \)

Clearly, on \( \mathcal{P}^{-} \), if \( x \ll y \) then \( x \leq y. \)

**Remark 1.** The lattice \( (\mathcal{P}^{-}, \leq) \) is a complete lattice [19] but \( (\mathcal{P}^{-}, \ll) \) is not. For example, let \( x = (0.2, 0.3, 0.5) \) and \( y = (0.3, 0.0, 0.7) \), then there is not any supremum value of \( x \) and \( y \) on \( (\mathcal{P}^{-}, \ll). \)

Otherwise, we have \( \sup (x, y) = (0.3, 0.0, 0.5) \) on the lattice \( (\mathcal{P}^{-}, \leq) \). We denote the units of \( (\mathcal{P}^{-}, \leq) \) as follows \( 0_{\mathcal{P}^{-}} = (0.0, 0.1) \) and \( 1_{\mathcal{P}^{-}} = (0.0, 0.0) \) [19]. It is easy to see that \( 0_{\mathcal{P}^{-}} \) and \( 1_{\mathcal{P}^{-}} \) are also the units on \( (\mathcal{P}^{-}, \ll). \) Now, some logic operators on \( \text{PFS}(\chi) \) are presented.

**Definition 6.** [19] A picture fuzzy negation \( \mathcal{N} \) is a function satisfying

\[
\mathcal{N} : \mathcal{P}^{-} \rightarrow \mathcal{P}^{-}, \mathcal{N}(0_{\mathcal{P}^{-}}) = 1_{\mathcal{P}^{-}}, \mathcal{N}(1_{\mathcal{P}^{-}}) = 0_{\mathcal{P}^{-}}, \text{ and } \mathcal{N}(x) \geq \mathcal{N}(y) \iff x \leq y.
\]

**Example 1.** For every \( x \in \mathcal{P}^{-} \), then \( \mathcal{N}_{\varnothing}(x) = (x_2, 0, x_3) \) and \( \mathcal{N}_{\eta}(x) = (x_3, x_4, x_5) \) are picture fuzzy negations, where \( x_4 = 1 - x_1 - x_2 - x_3. \)

**Remark 2.** The operator \( \mathcal{N}_{\varnothing} \) also satisfies \( \mathcal{N}_{\varnothing}(x) \Rightarrow \mathcal{N}_{\varnothing}(y) \iff x \ll y, \forall x, y \in \mathcal{P}^{-}. \)

Now, let \( x, y, z \in \mathcal{P}^{-} \) and \( \mathcal{I}(x) = \{ y \in \mathcal{P}^{-} : y = (x_1, y_2, x_3), 0 \leq y_2 \leq x_2 \}. \)

**Definition 7.** [19] A picture fuzzy t-norm \( \mathcal{T} \) is a function satisfying

\[
\mathcal{T} : \mathcal{P}^{-} \times \mathcal{P}^{-} \rightarrow \mathcal{P}^{-}, \mathcal{T}(x, y) = T(y, x), \mathcal{T}(x, y, z) = \mathcal{T}(x, T(y, z)),
\]

\[
\mathcal{T}(1_{\mathcal{P}^{-}}, x) \in \mathcal{I}(x), \text{ and } \mathcal{T}(x, y) \leq \mathcal{T}(x, z), \forall y \leq z.
\]
Definition 8. [19] A picture fuzzy t-conorm $S$ is a function satisfying

$$S : P^* \times P^* \to P^*, \quad S(x, y) = S(y, x), \quad S(S(x, y), z) = S(x, S(y, z)), \quad S(0_p, x) \in I(x), \text{ and } S(x, y) \leq S(x, z), \forall y \leq z.$$ 

Example 2. For all $x, y \in P^*$, the following operators are the picture fuzzy t-norms:

- $T_0(x, y) = (\min(x_1, y_1), \min(x_2, y_2), \max(x_3, y_3)).$
- $T_1(x, y) = (x_1y_1, x_2y_2, x_3 + y_3 - x_2y_3).$
- $T_2(x, y) = (\max(0, x_1 + y_1 - I), \max(0, x_2 + y_2 - I), \min(1, x_3 + y_3)).$
- $T_3(x, y) = (\max(0, x_1 + y_1 - I), \max(0, x_2 + y_2 - I), x_3 + y_3 - x_3y_3).$
- $T_4(x, y) = (x_1y_1, \max(0, x_2 + y_2 - I), x_3 + y_3 - x_3y_3).$
- $T_5(x, y) = (\max(0, x_1 + y_1 - I), x_1y_2, x_3 + y_3 - x_3y_3).$

Example 3. For all $x, y \in P^*$, the following operators are the picture fuzzy t-conorms:

- $S_0(x, y) = (\max(x_1, y_1), \max(0, x_2 + y_2 - I), \min(x_3, y_3)).$
- $S_1(x, y) = (x_1 + y_1 - x_1y_1, x_2y_2, x_3y_3).$
- $S_2(x, y) = (\min(1, x_1 + y_1), \max(0, x_2 + y_2 - I), \max(0, x_3 + y_3 - I)).$
- $S_3(x, y) = (x_1 + y_1 - x_1y_1, \max(0, x_2 + y_2 - I), \max(0, x_3 + y_3 - I)).$
- $S_4(x, y) = (x_1 + y_1 - x_1y_1, \max(0, x_2 + y_2 - I), x_3y_3).$
- $S_5(x, y) = (x_1 + y_1 - x_1y_1, \max(0, x_2 + y_2 - I), \max(0, x_3 + y_3 - I)).$

Remark 3. For all $x, y, z \in P^*$ and $y \ll z$, the operators $T_i(i = 0, \ldots, 5)$ also satisfy the condition $T(x, y) \ll T(x, z)$. Similarly, $S_i(i = 0, \ldots, 5)$ also satisfy $S(x, y) \ll S(x, z)$.

The logic operators $N, T$ and $S$ on $P^*$ are corresponding to the basic set-theory operators on $\text{PFS}(X)$ as follows.

Definition 9. Let $N, T$ and $S$ be the picture fuzzy negation, t-norm and t-conorm, respectively, and $A, B \in \text{PFS}(X)$. Then, the complement of $A$ w.r.t $N$ is defined as follows:

$$\overline{A}_N = \{x : N((\mu_\lambda(x), \eta_\lambda(x), \nu_\lambda(x)))\} \in X,$$

the intersection of $A$ and $B$ w.r.t $T$ is defined as follows:

$$A \cap_T B = \{x : T((\mu_\lambda(x), \eta_\lambda(x), \nu_\lambda(x))((\mu_\beta(x), \eta_\beta(x), \nu_\beta(x)))\} \in X,$$

$$A \cap_T B = \{x : T((\mu_\lambda(x), \eta_\lambda(x), \nu_\lambda(x))((\mu_\beta(x), \eta_\beta(x), \nu_\beta(x)))\} \in X,$$
and the union of $A$ and $B$ w.r.t $T$ is defined as follows:

$$A \cup_b B = \left\{ x : S(\mu_A(x), \eta_A(x), \nu_A(x), \mu_B(x), \eta_B(x), \nu_B(x)) \right\} | x \in X^{1}.$$  

(9)

3. The Single-valued Neutrosophic Distance Measure and the Picture Fuzzy Distance Measure

Recently, Wei has introduced the generalized Dice similarity measures for picture fuzzy sets [17]. However, the definition of Wei is without considering the condition related to order relation on picture fuzzy sets. The new distance measure on picture fuzzy sets is proposed in this section. It is developed from intuitionistic distance measure of Wang et al. [32] and Ngan et al. [8].

**Definition 10.** A single-valued neutrosophic distance measure $d$ is a function satisfying

- $d : N^{+} \times N^{+} \rightarrow [0, +\infty)$,
- $d(x, y) = d(y, x)$,
- $d(x, y) = 0 \iff x = y$,
- If $x \ll y \ll z$ then $d(x, y) \leq d(x, z)$ and $d(y, z) \leq d(x, z)$.

**Definition 11.** A picture fuzzy distance measure $d$ is a single-valued neutrosophic distance measure and $d(x, y) \in [0, 1]$, $\forall x, y \in P^{+}$.

**Definition 12.** The measure $D_{0}$ is defined as follows

$$D_{0}(x, y) = \frac{1}{3} \left| |x_{1} - y_{1}| + |x_{2} - y_{2}| + |x_{3} - y_{3}| + \max \{x_{i}, y_{j}\} - \max \{x_{i}, y_{j}\} \right|, \forall x, y \in P^{+}.$$  

(10)

**Proposition 1.** The measure $D_{0}$ is a picture fuzzy distance measure.

**Proof.** Firstly, we have $\max \{x_{i}, y_{j}\} = \max \{x_{i}, y_{j}\} \in [0, 1]$ and

$$|x_{1} - y_{1}| + |x_{2} - y_{2}| + |x_{3} - y_{3}| \leq (|x_{1}| + |y_{1}|) + (|x_{2}| + |y_{2}|) + (|x_{3}| + |y_{3}|) \leq (x_{1} + x_{2} + x_{3}) + (y_{1} + y_{2} + y_{3}) \leq 2.$$

Therefore, $0 \leq \frac{1}{3} \left| |x_{1} - y_{1}| + |x_{2} - y_{2}| + |x_{3} - y_{3}| + \max \{x_{i}, y_{j}\} - \max \{x_{i}, y_{j}\} \right| \leq 1.$

Secondly, we obtain that $D_{0}(x, y) = D_{0}(y, x)$ since $D_{0}$ has the symmetry property between the arguments.

Thirdly, $D_{0}(x, y) = 0 \iff |x_{1} - y_{1}| = |x_{2} - y_{2}| = |x_{3} - y_{3}| = \max \{x_{i}, y_{j}\} - \max \{x_{i}, y_{j}\} = 0 \iff x = y$.

Finally, let $x \ll y \ll z$, then $x_{1} \leq y_{1} \leq z_{1}, x_{2} \leq y_{2} \leq z_{2}, x_{3} \geq y_{3} \geq z_{3}$. We obtain that
\[ |x_i - y_i| \leq |x_i - z_i|, |x_2 - y_2| \leq |x_2 - z_2|, |x_3 - y_3| \leq |x_3 - z_3|, \]

Moreover, \( \max\{z_i, x_j\} \geq \max\{y_i, x_j\} \geq \max\{y_i, z_j\} \). Hence, \( \lim_{x \to \infty} |\max\{x_i, y_j\} - \max\{x_i, z_j\}| \) is an equivalent distance measure \( D_0(x, y) \leq D_0(x, z) \). Similarly, we also have \( D_0(y, z) \leq D_0(x, z) \).

**Remark 4.** If \( d \) is a picture fuzzy distance measure, then \( d \) is a single-valued neutrosophic distance measure. The opposite is not necessarily true. Some picture fuzzy operations were introduced by the group of authors of this paper [18, 19]. Hence, this research is seen as a complete link to the authors’ previous work on picture fuzzy inference systems. An inference system of neutrosophic theory will be developed in another paper as a future work.

**Proposition 2.** Let \( x, y \in \mathbb{P} \). The measure \( D_0 \) satisfies the following properties:

- \( D_0(N_0(x), N_0(x)) = \frac{1}{3} x_i \).
- If \( x_2 \geq x_i \), then \( D_0(x, N_0(x)) - D_0(x, N_0(x)) = \frac{1}{3} x_i \).
- \( D_0(x, N_0(y)) - D_0(N_0(x), y) = \frac{1}{3} |x_2 - y_i| \).
- \( D_0(x, y) - D_0(N_0(x), N_0(y)) = \frac{1}{3} |x_2 - y_i| \).
- If \( x_i + x_2 = y_i + y_2 \), then \( D_0(x, y) = D_0(N_0(x), N_0(y)) \).
- If \( x_i + x_2 = y_2 + y_3 \), then \( D_0(x, y) = D_0(N_0(x), N_0(y)) \).
- \( D_0(x, N_0(x)) = \frac{x_i - x_2}{3} \).
- \( D_0(x, N_0(x)) = \frac{x_i - x_2}{3} + \frac{1}{3} x_i \).
- \( D_0(x, N_0(x)) = \frac{1}{3} (2 - 2x_i + x_i + x_i) \).
- \( D_0(x, 0, y) = \frac{1}{3} (2 - 2x_i + x_i + x_i) \).
- \( D_0(0, y) = 1 \).
- \( D_0(x, N_0(x)) = 1 \) if and only if \( x \in \{0, 0\} \).
- \( D_0(x, N_0(x)) = 1 \) if and only if \( x \in \{0, 0\} \).
- \( D_0(x, N_0(x)) = 0 \) if and only if \( x_i + x_2 = 0 \).
- \( D_0(x, N_0(x)) = 0 \) if and only if \( x_i + x_2 = 0 \).
- \( D_0((0, 0, 0), (0, a, 0)) < D_0((0, 0, 0), (a, 0, 0)) = D_0((0, 0, 0), (0, 0, 0)) \).
- \( D_0((0, 0, 0), (a, 0, 0)) = D_0((0, 0, 0), (0, 0, 0)) \).

**Proof.** These properties are proved as follows:
The Picture Fuzzy Distance Measure in Controlling Network Power

- We have \( D_0 (N_o (x), N_o (x)) = D_o ((x_j, 0, x_i), (x_j, x_i)) \)

\[ D = \frac{1}{3} \left( |x_j - x_i| + |o - x_i| + |x_j - x_i| + \max \{x_j, x_i\} - \max \{x_j, x_i\} \right) = \frac{1}{3} x_i. \]

- We have

\[ |D_o (x, N_o (x)) - D_o (x, N_o (x))| = \left| D_o ((x_j, x_j, x_i), (x_j, x_i, x_j)) - D_o ((x_j, x_j, x_i), (x_j, x_i, x_j)) \right| \]

\[ = \frac{1}{3} \left( |x_j - x_i| + |x_j - x_i| + \max \{x_j, x_i\} - \max \{x_j, x_i\} \right) \]

\[ = \frac{1}{3} |x_j - x_i| = \frac{1}{3} x_i. \]

- We have

\[ |D_o (x, N_o (y)) - D_o (N_o (y), y)| = |D_o ((x_j, x_j, y_i), (y_j, y_j, y_i)) - D_o ((x_j, x_j, y_i), (y_j, y_j, y_i))| \]

\[ = \frac{1}{3} \left( |x_j - y_i| + |y_j - y_i| + \max \{x_j, y_i\} - \max \{y_j, x_i\} \right) \]

\[ = \frac{1}{3} |x_j - y_i| = \frac{1}{3} y_i. \]

- We have

\[ |D_o (x, y) - D_o (N_o (x), N_o (y))| = |D_o ((x_j, x_j, x_i), (y_j, y_j, y_i)) - D_o ((x_j, x_j, y_i), (y_j, y_j, y_i))| \]

\[ = \frac{1}{3} \left( |x_j - y_j| + |y_j - x_j| + \max \{x_j, y_j\} - \max \{x_j, y_j\} \right) \]

\[ = \frac{1}{3} |x_j - y_j| = \frac{1}{3} y_j. \]

- We have \( D_0 (N_o (x), N_o (y)) = D_0 ((x_j, x_i, x_j), (y_j, y_i, y_j)) \)

\[ = \frac{1}{3} \left( |x_j - x_i| + |x_j - y_i| + |x_j - y_j| + \max \{x_j, y_i\} - \max \{y_j, x_i\} \right). \]

Further, \( |x_j - y_i| = \left| (x_j - x_i) - (y_j - y_i) \right| = |x_j - y_i| \). Thus, \( D_o (N_o (x), N_o (y)) = D_o (x, y) \).
We have $D_o(x, N_o(y)) = D_o((x_1, x_2, x_3), (y_1, y_2, y_3))$

$$= \frac{1}{3}[(x_1 - y_1) + |x_2 - y_2| + |x_3 - y_3| + \max\{x_1, y_1\} - \max\{y_1, x_1\}]$$. In other hand,

$$D_o(N_o(x), y) = D_o((x_1, x_2, x_3), (y_1, y_2, y_3))$$

$$= \frac{1}{3}[(x_1 - y_1) + |x_2 - y_2| + |x_3 - y_3| + \max\{x_1, y_1\} - \max\{y_1, x_1\}]$$. Further,

$|x_2 - y_2| = |x_2 - 1 + y_2 + y_2 + y_3| = |x_2 - 1 + x_1 + y_2 + x_3| = |y_2 - x_4|$. Thus,

$$D_o(x, N_o(y)) = D_o(N_o(x), y), \lim \epsilon \to \infty$$

We have $D_o(x, N_o(x)) = D_o((x_1, x_2, x_3), (x_1, 0, x_1))$

$$= \frac{1}{3}[(x_1 - x_1) + |x_2 - 0| + |x_3 - x_1| + \max\{x_1, x_1\} - \max\{x_1, x_1\}] = |x_1 - x_3| + \frac{1}{3}x_3$.

We have $D_o(x, I_o) = D_o((x_1, x_2, x_3), (1, 0, 0))$

$$= \frac{1}{3}[(x_1 - 1) + |x_2 - 0| + |x_3 - 0| + \max\{x_1, 0\} - \max\{x_3, 0\}] = \frac{1}{3}(2x_1 + x_2 + x_3)$.

We have $D_o(x, 0_o) = D_o((x_1, x_2, x_3), (0, 0, 1))$

$$= \frac{1}{3}[(x_1 - 0) + |x_2 - 0| + |x_3 - l| + \max\{x_1, 0\} - \max\{x_3, 0\}] = \frac{1}{3}(2x_2 + x_1 + x_3)$.

We have $D_o(0_o, I_o) = D_o((1, 0, 0), (0, 0, l)) = l$.

Assume that $D_o(x, N_o(x)) = 1$, we have $|x_1 - x_3| + \frac{1}{3}x_2 = 1$. Since $|x_1 - x_3| + \frac{1}{3}x_2 \leq (x_1 + x_3) + x_3 \leq 1$.

Therefore, $|x_1 - x_3| + \frac{1}{3}x_2 = (x_1 + x_3) + x_2 = 1$. We obtain that $x_2 = 0$ and $|x_1 - x_3| = 1$. Thus, $x \in \{0_o, I_o\}$. Assume that $D_o(x, N_o(x)) = 1$, we have $|x_1 - x_3| + \frac{1}{3}x_2 - x_4 = 1$. Since $|x_1 - x_3| + \frac{1}{3}x_2 - x_4 \leq (x_1 + x_3) + (x_2 + x_4) = 1$. We obtain that $x_2 = x_4 = 0$ and $|x_1 - x_3| = 1$. Thus,
The Picture Fuzzy Distance Measure in Controlling Network Power

\( x \in \{ \varnothing, I_\varnothing \} \). Assume that \( D_a(x, N_\varnothing(x)) = 0 \), we have \( |x_j - x_i| + \frac{1}{3} |x_j - x_i| = 0 \). Hence, \( x_j = 0 \) and \( x_i = x_j \).

Assume that \( D_a(x, N_\varnothing(x)) = 0 \), we have \( |x_j - x_i| + \frac{1}{3} |x_j - x_i| = 0 \). Hence, \( x_j = x_i \) and \( x_i = x_j \).

We have \( D_a((0,0,0),(0,a,0)) = \frac{a}{3} \).

\( D_a((0,0,0),(a,0,0)) = D_a((0,0,0),(0,0,a)) = \frac{2a}{3} \), and

\( D_a((a,0,0),(0,0,a)) = D_a((a,0,0),(0,a,0)) = D_a((0,0,0),(0,a,0)) = a \).

**Remark 5.** The order “\( \prec \)” on \( P^* \) corresponds to the following order on \( \text{PFS}(X) \):

\[
A \preceq B \iff \mu_A(x) \leq \mu_B(x),\eta_A(x) \leq \eta_B(x),\nu_A(x) \geq \nu_B(x), \forall x \in X.
\]

(11)

**Remark 6.** The picture fuzzy distance measure on \( P^* \) corresponds to the picture fuzzy distance measure on \( \text{PFS}(X) \), i.e., for all \( A, B \in \text{PFS}(X = \{x_1, x_2, \ldots, x_m\}) \), we have the picture fuzzy distance measure \( D_a \) between \( A \) and \( B \) as follows:

\[
D_a(A, B) = \frac{1}{3m} \sum_{i=1}^{m} \left[ |\mu_A(x_i) - \mu_B(x_i)| + |\eta_A(x_i) - \eta_B(x_i)| + |\nu_A(x_i) - \nu_B(x_i)| + \max\lbrace \mu_A(x_i) - \nu_B(x_i) \rbrace - \max\lbrace \nu_A(x_i) - \mu_B(x_i) \rbrace \right].
\]

(12)

**Proposition 3.** Consider the picture fuzzy distance measure \( D_a \) in Eq. (10), the picture fuzzy t-norms \( T_{\lambda \circ \varnothing, \varnothing} \) in Example 2, the picture fuzzy t-conorms \( S_{\lambda \circ \varnothing, \varnothing} \) in Example 3, and the picture fuzzy negation \( N_\varnothing \) in Example 1. Let \( A \) and \( B \) be two picture fuzzy sets on the universe \( X = \{x_1, x_2, \ldots, x_m\} \). Then, we have the following properties:

\[
D_a(A \cap \lambda, B) \geq \max \left\{ D_a(A \cap \lambda, B) \cap \lambda, D_a(A \cap \lambda, B) \cap \lambda \right\},
\]

\[
D_a(A \cap \lambda, B) \geq \max \left\{ D_a(A \cap \lambda, B) \cap \lambda, D_a(A \cap \lambda, B) \cap \lambda \right\},
\]

\[
D_a(A \cap \lambda, B \cap \lambda, A \cap \lambda, B) \geq \max \left\{ D_a(A \cap \lambda, B \cap \lambda, A \cap \lambda, B), D_a(A \cap \lambda, B \cap \lambda, A \cap \lambda, B) \right\},
\]

\[
D_a(A \cap \lambda, B \cap \lambda, A \cap \lambda, B) \geq \max \left\{ D_a(A \cap \lambda, B \cap \lambda, A \cap \lambda, B), D_a(A \cap \lambda, B \cap \lambda, A \cap \lambda, B) \right\},
\]

\[
\forall (i, j) \in \{(x, y) | x, y = 0, \ldots, 5 \} \setminus \{(4, 5) \} \text{ and } k = 0, 1, 3, 4, 5.
\]
\[- \begin{array}{c}
\max_{y \in \mathbb{R}} \left( f(x) \right) = \max \{ f(x_1), f(x_2), \ldots, f(x_n) \},
\end{array}\]

\[- \begin{array}{c}
\min_{y \in \mathbb{R}} \left( f(x) \right) = \min \{ f(x_1), f(x_2), \ldots, f(x_n) \}.
\end{array}\]

\[- \begin{array}{c}
\max_{y \in \mathbb{R}} \left( f(x) \right) = \max \{ f(x_1), f(x_2), \ldots, f(x_n) \},
\end{array}\]

\[- \begin{array}{c}
\min_{y \in \mathbb{R}} \left( f(x) \right) = \min \{ f(x_1), f(x_2), \ldots, f(x_n) \}.
\end{array}\]

**Proof.** These properties are proved as follows. Firstly, we see that for all \( x, y \in [0,1] \),

\[- \begin{array}{c}
\max(0, x + y - 1) \leq xy \leq \min(x, y) \quad \text{and} \quad \min(1, x + y) \geq x + y - xy \geq \max(0, x + y - 1). \text{Hence,}
\end{array}\]

\[- \begin{array}{c}
(\max(0, x_1 + y_1 - 1), \max(0, x_2 + y_2 - 1), \min(1, x_3 + y_3)) \leq (x_1, y_1, x_2, y_2, x_3, y_3). \text{This means} \ T_2 \leq T_3.
\end{array}\]

Similarly, we obtain that \( T_2 \leq T_3 \leq T_4 \leq T_5 \leq T_6 \leq T_7 \leq T_8 \leq T_9 \leq T_{10} \). Hence,

\[- \begin{array}{c}
A \cap \gamma_2 B \subseteq A \cap \gamma_3 B \subseteq A \cap \gamma_4 B \subseteq A \cap \gamma_5 B \subseteq A,
\end{array}\]

\[- \begin{array}{c}
A \cap \gamma_2 B \subseteq A \cap \gamma_3 B \subseteq A \cap \gamma_4 B \subseteq A \cap \gamma_5 B \subseteq A \cap \gamma_6 B \subseteq A,
\end{array}\]

\[- \begin{array}{c}
A \cap \gamma_2 B \subseteq A \cap \gamma_3 B \subseteq A \cap \gamma_4 B \subseteq A \cap \gamma_5 B \subseteq A \cap \gamma_6 B \subseteq A,
\end{array}\]

\[- \begin{array}{c}
A \cap \gamma_2 B \subseteq A \cap \gamma_3 B \subseteq A \cap \gamma_4 B \subseteq A \cap \gamma_5 B \subseteq A \cap \gamma_6 B \subseteq A, \text{and}
\end{array}\]

\[- \begin{array}{c}
A \cap \gamma_2 B \subseteq A \cap \gamma_3 B \subseteq A \cap \gamma_4 B \subseteq A \cap \gamma_5 B \subseteq A \cap \gamma_6 B \subseteq A.
\end{array}\]
The Picture Fuzzy Distance Measure in Controlling Network Power...

Since $D_0$ is the picture fuzzy distance measure, thus

$$D_0(A \cap_{\mu_j} B, A) \geq \max \left\{ D_0(A \cap_{\mu_j} B, A \cap_{\mu_j} B), D_0(A \cap_{\mu_j} B, A) \right\}$$

and

$$D_0(A \cap_{\mu_j} B, B) \geq \max \left\{ D_0(A \cap_{\mu_j} B, A \cap_{\mu_j} B), D_0(A \cap_{\mu_j} B, B) \right\} ,$$

$\forall (i, j) \in \{(x, y) | x, y = 0, 1, 3, 4, 5\}$ and $k = 0, 1, 3, 4, 5$. Furthermore, we have

$$\overline{A}_N = \left\{ \left( x : N_0 \left( (\mu_x (x), \eta_x (x), \nu_x (x)) \right) \right) \left| x \in X \right. \right\} = \left\{ \left( x : (\nu_x (x), 0, \mu_x (x)) \right) \left| x \in X \right. \right\} \Theta .$$

It is easy to prove the following lemma: If $A \subseteq B$, then $\overline{B}_N \subseteq \overline{N}_N$. Thus,

$$D_0(A \cap_{\mu_j} B^N, \overline{A}_N) \geq \max \left\{ D_0(A \cap_{\mu_j} B^N, A \cap_{\mu_j} B^N), D_0(A \cap_{\mu_j} B^N, \overline{A}_N) \right\}$$

and

$$D_0(A \cap_{\mu_j} B^N, \overline{B}_N^N) \geq \max \left\{ D_0(A \cap_{\mu_j} B^N, A \cap_{\mu_j} B^N), D_0(A \cap_{\mu_j} B^N, \overline{B}_N) \right\} ,$$

$\forall (i, j) \in \{(x, y) | x, y = 0, 1, 3, 4, 5\}$ and $k = 0, 1, 3, 4, 5$.

Secondly, we have $S_5 \ll S_6 \ll S_7 \ll S_8 \ll S_9 \ll S_2$, and $S_5 \ll S_6 \ll S_7 \ll S_9$. Hence,

$$A \subseteq A \cup S_5 B \subseteq A \cup S_5 B \subseteq A \cup S_5 B \subseteq A \cup S_5 B ,$$

$$B \subseteq A \cup S_5 B \subseteq A \cup S_5 B \subseteq A \cup S_5 B \subseteq A \cup S_5 B ,$$

$$A \subseteq A \cup S_5 B \subseteq A \cup S_5 B \subseteq A \cup S_5 B \subseteq A \cup S_5 B ,$$

and

$$B \subseteq A \cup S_5 B \subseteq A \cup S_5 B \subseteq A \cup S_5 B \subseteq A \cup S_5 B.$$

Therefore

$$D_0(A \cup S_5 B, A) \geq \max \left\{ D_0(A \cup S_5 B, A \cup S_5 B), D_0(A \cup S_5 B, A) \right\} ,$$

$$D_0(A \cup S_5 B, B) \geq \max \left\{ D_0(A \cup S_5 B, A \cup S_5 B), D_0(A \cup S_5 B, B) \right\} ,$$

$$D_0(A \cup S_5 B^N, \overline{A}_N) \geq \max \left\{ D_0(A \cup S_5 B^N, A \cup S_5 B^N), D_0(A \cup S_5 B^N, \overline{A}_N) \right\} ,$$

and

$$D_0(A \cup S_5 B^N, \overline{B}_N) \geq \max \left\{ D_0(A \cup S_5 B^N, A \cup S_5 B^N), D_0(A \cup S_5 B^N, \overline{B}_N) \right\} ,$$

$\forall (i, j) \in \{(x, y) | x, y = 0, 1, 3, 4, 5\} \setminus \{(1, 3)\}$ and $k = 0, 1, 3, 4$.

Now, we have $A \subseteq A \cup S_5 B \subseteq A \cup S_5 B \subseteq A \cup S_5 B \subseteq A \cup S_5 B$ and
Thus, for all $i, j = 0, 2, 3, 4$, and $k = 0, 3, 4$, we have

$$D_b(A \cup_S B, A) \geq \max \left\{ D_b\left(A \cup_S B, A \cup_S B \right) , D_b\left(A \cup_S B, A \right) \right\},$$

$$D_b(A \cup_S B, B) \geq \max \left\{ D_b\left(A \cup_S B, A \cup_S B \right) , D_b\left(A \cup_S B, B \right) \right\},$$

$$D_b\left(A \cup_S B, A^{N_k}, A^{N_k}\right) \geq \max \left\{ D_b\left(A \cup_S B, A^{N_k}, A^{N_k}\right) , D_b\left(A \cup_S B, A^{N_k}, A^{N_k}\right) \right\} \text{ and}$$

$$D_b\left(A \cup_S B, A^{N_k}, B^{N_k}\right) \geq \max \left\{ D_b\left(A \cup_S B, A^{N_k}, B^{N_k}\right) , D_b\left(A \cup_S B, A^{N_k}, B^{N_k}\right) \right\}.$$ 

Finally, we see that $A \cap_{\tau_i} B \subseteq A \cap_{\tau_6} B \subseteq A \subseteq A \cup_S B \subseteq A \cup_S B$.

Thus, we obtain that $D_b\left(A \cap_{\tau_i} B, A \cup_S B \right) \geq D_b\left(A \cap_{\tau_6} B, A \cup_S B \right)$ and the remaining inequalities of Proposition 3.

### 4. An Application of the Picture Fuzzy Distance Measure for Controlling Network Power Consumption

#### 4.1. Figures and Tables

The interconnection network is important in the parallel computer systems. Saving interconnection network power is always interested, researched and becoming more and more urgent in the current technological era. In order to achieve high performance, the architectural design of the interconnection network requires an effective power saving mechanism. The aim of this mechanism is to reduce the network latency (the average latency of a message) and the percentages between the number of links that are kept switched on by the saving mechanism and the total number of links [25]. As a simplified way of understanding, this is a matter of optimizing the number of links opened in a networking system. This is a decision-making problem for the trunk link state.

In 2010, Alonso et al. introduced the power saving mechanism in regular interconnection network [25]. This model dynamically increases or reduces the number of links that compose a trunk link. This is done by measuring network traffic and dynamically turning these individual links on or off based on a $u_{\text{on}} / u_{\text{off}}$ threshold policy with keeping at least one operational link (see Fig. 1 and Fig. 2).

The two parameters $u_{\text{on}}$ and $u_{\text{off}}$ are designed based on different requirements of mechanism aggressiveness (controlled by the value $u_{\text{avg}} = (u_{\text{on}} + u_{\text{off}}) / 2$) and mechanism responsiveness (controlled by the difference $u_{\text{on}} - u_{\text{off}}$).
In order to avoid the possibility of cyclic state transitions that makes the system become unstable, the following restrictions hold in the selection $u_{on}$ and $u_{off}$:

$$0 < u_{off} \leq \frac{u_{on}}{2} \leq \frac{U \max}{2}.$$  \hspace{1cm} (13)

Thus, the different values of $u_{off}$ and $u_{on}$ that satisfy Eq. (13) are stably chosen in order to achieve different goals of responsiveness and aggressiveness for the power saving mechanism. In 2015, they continue to study and modify power consumption control in fat-tree interconnection networks based on the static and dynamic thresholds policies [26]. In general, this threshold policy is hard because it is without any fuzzy approaches, parameter learning and optimizing processes.

In 2017, Phan et al. [27] proposed a new method in power consumption estimation of network-on-chip based on fuzzy logic [27]. However, this fuzzy logic system based on Sugeno model is too rudimentary and the parameters here are chosen according to the authors’ quantification. In this paper, aiming to replace the above threshold policy in decision making problem for the trunk link state, we propose a higher-level fuzzy system based on the proposed single-valued neutrosophic distance measure in Section 3.

4.2. The Adaptive Neuro Picture Fuzzy Inference System (ANPFIS)

In this subsection, an ANPFIS based on picture fuzzy distance measure is introduced to decision making problems. ANPFIS is a modification and combination between ANFIS [28], picture fuzzy set, and picture fuzzy distance measure. Hence, ANPFIS operates based on the picture fuzzification and defuzzification
processes, the picture fuzzy operators and distance measure, and the learning capability for automatic picture fuzzy rule generation and parameter optimization. The model is showed as in the Fig. 3.

![Diagram](image)

**Fig. 3.** The proposed ANPFIS decision making model.

The model has the inputs are number values and the output $S_i, i \in \{1, \ldots, n\}$ is the chosen solution. ANPFIS includes four layers as follows:

**Layer 1-Picture Fuzzification.** Each input value is connected to three neurons $Q_i$, in other words is fuzzified by three corresponding picture fuzzy sets named “High”, “Medium”, and “Low”. We use the Picture Fuzzy Gaussian Function (PFGF): the PFGF is specified by two parameters. The Gaussian function is defined by a central value $m$ and width $k > 0$. The smaller the $k$, the narrower the curve is. Picture fuzzy Gaussian positive membership, neutral, and negative membership functions are defined as follows

$$
\mu(x) = \exp\left(-\frac{(x-m)^2}{2k^2}\right),
$$

$$
\nu(x) = c_2(1-\mu(x)), \quad (c_2 \in [0,1]), \quad \text{and}
$$

$$
\eta(x) = c_2((1-\mu(x)) - \nu(x)), \quad (c_2 \in [0,1]), \quad \text{where the parameters} \quad m, k \quad \text{are trained.}
$$
Layer 2-Automatic Picture Fuzzy Rules. The picture fuzzy t-norm $T$ (see, Definition 7 and Example 2) is used in this step in order to establish the IF-THEN picture fuzzy rules, i.e., the links between the neurons $O_i$ of Layer 1 and the neurons $O^i_k$ of Layer 2 as follows

“If $O_i$ is $x$ and $O_j$ is $y$ then $O^i_k$ is $T(x,y)$.”

For examples $T(x,y) = T_i^i(x,y)$, where [18]

$$
T_i^i(x,y) = \left( \frac{x_1 y_1}{\lambda_1 + (1-\lambda_1)(x_2 + y_2 - x_1 y_1)} + \frac{x_2 y_2}{\lambda_2 + (1-\lambda_2)(x_2 + y_2 - x_1 y_1)} \right) \left( x_1^i + y_1^i - x_1^i y_1^i \right)^T,
$$

here $x, y \in D^r$, and the parameters $\lambda_1, \lambda_2, \lambda_3 \in [1, +\infty)$ are trained.

Layer 3 – Calculate the difference to the samples. The difference between the input $I$ and the sample $K$ is calculated by the proposed picture fuzzy distance measure $D_\beta$ in Eq. (10) as follows

$$
D_\beta(I,K) = \frac{1}{3m} \sum_{i=1}^{m} \left[ \mu_i(x_i) - \mu_j(x_j) + \eta_i(x_i) - \eta_j(x_j) + \nu_i(x_i) - \nu_j(x_j) \right] + \left[ \max \{ \mu_i(x_i), \nu_i(x_i) \} - \max \{ \mu_j(x_j), \nu_j(x_j) \} \right],
$$

where, $m$ is the number of attribute neuro values and $\omega_{i=1\ldots m}$ are the trained weights.

Layer 4-Picture Defuzzification. In this final step, we point out the minimum difference value in all values received from Layer 3,

$$
\text{Min} D_\beta(I,K) = D_\beta(I,K).
$$

Then, the output value of the ANPFIS is the solution $S$ which is corresponding to the sample $K_i$.

4.3. Application of the ANPFIS algorithm in Controlling Network Power Consumption

In this part, we present the installment of ANPFIS algorithm in the trunk link state Controller of interconnection network.
**Fig. 4.** The architecture of the trunk link state controller based on ANPFIS.

**Fig. 4** describes the architecture of the trunk link state Controller based on ANPFIS. This Controller is developed from the previous architecture which is proposed by Phan et al. in 2017 for network-on-chip [27]. For details, each router input port will be equipped with a traffic counter. These counters count the data flits passing through the router in certain clock cycles based on the corresponding response signals from the router. The flits through the router is counted in a slot of time. When the counting finish, the traffic through the corresponding port will be calculated [27]. Each port of the router is connected with a Counter, then there are four average values of the traffic.

- The Max Average (MA) block receives the values of traffic from the counters which are connected with the routers ports. It compares these values and chose the maximum value for Input 1 of the ANPFIS.
- The Derivative (DER) block calculates the derivative of traffics obtained from the counters. This value is defined as an absolute value of the traffics change in a unit of time. This value is determined according to the maximum traffic value decided by MA block. After that, the DER gives it to the Input 2 of the ANPFIS for further processes.

The value domain of Input 1 and Input 2 is from 0 to the maximum bandwidth value. They are normed into [0, 1] by Min Max normalization.

- Through the ANPFIS block, the received Output is the trunk link state $S_i, i \in \{1, 2, 3, 4\}$. The received new state are adjusted by the Link State Adjusting block.
5. Experiments on Real-World Datasets

5.1. Experimental Environments

In order to evaluate performance, we test the ANPFIS method on the real datasets of the network traffic history taken from the UPV (Universitat Politècnica de València) university with related methods. The descriptions of the experimental dataset are presented in Table 1.

| No. elements (checking-cycles) | 16.571 |
| No. attributes                | 2      |
| (MA, DER)                     |        |
| The normalized value domain of attributes | MA  [0,1] | DER [-1,1] |
| No. classes (No. link states) | 4      |

We compare the ANPFIS method against the methods of Hung (M2012) [21], Junjun et al. (M2013) [22], Maheshwari et al. (M2016) [23], Ngan et al. (H-max) [8], and ANFIS [28] in the Matlab 2015a programming language. The Mean Squared Error (MSE) degrees of these methods are given out to compare their performance.

5.2. The Quality

The MSE degree of the ANPFIS method are less than those of other methods. The specific values are expressed in Table 2.

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>MSE</td>
<td>0.2009</td>
<td>0.2606</td>
<td>0.2768</td>
<td>0.1259</td>
<td>0.2006</td>
<td>0.0089</td>
</tr>
</tbody>
</table>

Fig. 5 clearly show the difference between the performance values of six considered algorithms. In Fig. 5, the blue columns illustrate the MSE values of the methods. It can be seen that the columns of the other methods are higher than that of the ANPFIS method. That means the accuracy of the proposed method is better than that of the related methods on the considered dataset.
6. Conclusion

The neutrosophic theory increasingly attracts researchers and is applied in many fields. In this paper, a new single-valued neutrosophic distance measure is proposed. It is also a distance measure between picture fuzzy sets and is a development of the H-max measure which was introduced by Ngan et al. [8]. Further, an Adaptive NPFIS based on the proposed measure is shown and applied to the decision making for the link states in interconnection networks. The proposed model is tested on the real datasets taken from the UPV university. The MSE value of the proposed methods is less than that of other methods.

Appendix

Source code and datasets of this paper can be found at this link, https://sourceforge.net/projects/pfdm-datasets-code/.
