Abstract

For any positive integer n , let p_n be the n -th prime,
and let $u(n) = (10^{p_n} - 1)/9$. In this note we prove that if $p_n \equiv 1, 13, \text{ or } 19 \pmod{20}$, and $2p_n+1$ is also a prime, then $u(n)$ is not a prime.

For any positive integer n , let p_n be n -th prime,
and let $u(n) = (10^{p_n} - 1)/9$. Then the sequence $U = \{u(n)\}_{n=1}^{\infty}$
is called the Smarandache unary sequence (see [2]).
It is an odd question that if U contain infinit many primes?
In this note we prove the following result:

Theorem. If $p_n \equiv 1, 13, \text{ or } 19 \pmod{20}$, and $2p_n+1$ is also a prime, then $u(n)$ is not a prime.

By using the above result, we see that both $u(12)$ and $u(15)$ are not primes.

Proof of Theorem. Let $q = 2p_n+1$. By Fermat's theorem (see[1], Theorem 71]), if q is a prime, then we have

$$(1) \quad 10^{q-1} \equiv 1 \pmod{q}.$$

From (1), we get

$$(2) \quad (10^{p_n} + 1)(10^{p_n} - 1) \equiv 0 \pmod{q}.$$

Since q is a prime, we have either

$$(3) \quad q \mid 10^{p_n} + 1$$

or

$$(4) \quad q \mid 10^{p_n} - 1,$$

by (2).

We now assume that p_n satisfies $p_n \equiv 1, 13, \text{ or } 19 \pmod{20}$.

Then p_n is an odd prime. Hence, if (3) holds, then we have

$$(5) \quad \left(\frac{-10}{q}\right) = 1,$$

where $(-10/9)$ is the Legendre symbol. Since $q = 2p_n + 1$, we have $q \equiv 3 \pmod{4}$ and $(-1/q) = -1$. Therefore, we obtain from (5) that

$$(6) \quad (10/q) = (2/q)(5/q) = -1.$$

However, since $q \equiv 3, 27, \text{ or } 39 \pmod{40}$ if $p_n \equiv 1, 13, \text{ or } 19 \pmod{20}$ respectively, we have

$$(7) \quad (2/q) = \begin{cases} -1, & \text{if } q \equiv 3 \text{ or } 27 \pmod{40}; \\ 1, & \text{if } q \equiv 39 \pmod{40}. \end{cases} \quad (5/q) = \begin{cases} -1, & \text{if } q \equiv 3 \text{ or } 27 \pmod{40}; \\ 1, & \text{if } q \equiv 39 \pmod{40}. \end{cases}$$

We find for (7) that $(10/q) = 1$, which contradicts (6). It implies that (3) does not hold. Thus, by (4), we get

$$(8) \quad q \mid 9u(n).$$

Notice that $q \neq 9$ and $1 < q < u(n)$. We see from (8) that $q \mid u(n)$ and $u(n)$ is not a prime. The theorem is proved.
