## Abstract

For any positive integer k, let $A_k$ be the Smarandache k-power product sequence. In this paper we prove that if k is an odd integer, with k>1, then $A_k$ contains only one prime 2.

In [1], Iacobescu defined the sequence $\{1+c_1c_2\ldots c_n\}_{n=1}^{\infty}$; is the Smarandache cubic product sequence, where $c_n$ is the n-th cubic number. Simultaneous, he posed the following question:

Question: Hou many primes are in the sequence $\{1+c_1c_2\ldots c_n)_{n=1}^{\infty}$ ?

We nou give a general definition as follows:
For any positive integers k, n let

(1) $$a_k(n) = 1+1^k2^k\ldots n^k,$$

and let $A_k = \{a_k(n)\}_{n=1}^{\infty}$. Then $A_k$ is called the Smarandache k-power product sequence. In this paper we prove the following result:

Theorem. If k is an odd integer, with k>1, then $A_k$ contains only one prime 2.

Clearly, the above result completely solves Iacobescu's question.

Proof of Theorem. We see from (1) that

(2) $$a_k(n) = 1 + (n!)^k.$$

If k is an odd integer, with k>1, then from (2) we get

(3) $$\begin{aligned} a_k(n) &= 1^k + (n!)^k \\ &= (1+n!)(1 - n! + (n!)^2 - \ldots - (n!)^{k-2} + (n!)^{k-1}). \end{aligned}$$

When n = 1, $a_k(1) = 2$ is a prime.

When n > 1, since

$1 + n! > 1$ and $1 - n! + (n!)^2 - \dots - (n!)^{k-2} + (n!)^{k-1} =$

$$((n!)^{k-1} - (n!)^{k-2}) + \dots + ((n!)^2 - n!) + 1 > 1,$$

we find from (3) that $a_k(n)$ is not a prime. Thus, the sequence $A_k$ contains only one prime 2. The theorem is proved.
